BIOLOGY DATA BOOK

FOREWORD

The Biology Data Book is the third of the Biological Handbooks to be issued under the general direction of the Committee on Biological Handbooks of the Federation of American Societies for Experimental Biology, Washington, D. C. This volume continues a series of handbooks prepared under the auspices of the National Academy of Sciences-National Research Council, the first of which was published in 1952.

Participation in this undertaking was fulfilled under National Institutes of Health Grant No. GM 06533, National Science Foundation Grant No. GN 255, and Air Force Contract No. AF 33(657)-10802.

Dr. J. W. Heim, Technical Director of the Biophysics Laboratory, Aerospace Medical Research Laboratories, Aerospace Medical Division, Wright-Patterson Air Force Base, Ohio, was the technical monitor for the Air Force. The Air Force participation in this undertaking is in support of Project No. 7164, "Biomedical Criteria for Aerospace Flight," Task No. 716406, "Systemization of Biological Knowledge."

The Committee on Biological Handbooks acknowledges with thanks the contribution of 470 botanists, zoologists, and basic medical scientists who have contributed so generously with their time and advice. The Committee thanks the National Institutes of Health, the National Science Foundation, and the Aerospace Medical Research Laboratories for the generous support and cooperation that have made possible the production of this book.

This technical report has been reviewed and is approved.

J. W. HEIM, PhD
Technical Director
Biophysics Laboratory

ABSTRACT

The Biology Data Book has been compiled to present numerical data of biology and medicine in a convenient and accessible form for reference, and to standardize accepted constants as a basis for correlation, establish common standards for statistical studies, and provide normal values for research. The biology data are organized in the form of tables, diagrams, charts, and graphs, arranged under the following headings: Genetics and Cytology, Reproduction, Development and Growth, Morphology, Nutrition and Digestion, Metabolism, Respiration and Circulation, Blood, Biological Regulators and Toxins, Biophysical and Biochemical Characteristics, Environment and Survival, Parasitism, and Materials and Methods. Seven appendices provide information concerning estimated number of species, taxonomic classification for living plants and animals, geologic distribution, atomic weights, as well as logarithms and antilogarithms. A detailed index completes the book. The contents have been authenticated by 470 authorities in the fields of biology and medicine. The review process of the tables was designed to eliminate, insofar as possible, errors of transcription and material of questionable validity.

COMMITTEE ON BIOLOGICAL HANDBOOKS

ABBREVIATIONS AND SYMBOLS

Measurements

ht = height
mi = mile
ft = foot
in. = inch
m = meter
km = kilometer
dm = decimeter
cm = centimeter
mm = millimeter
μ = micron
mμ = millimicron
Å = Ångström unit

yr = year
mo = month
wk = week
da = day
hr = hour
min = minute
sec = second

cgs = centimeter-gram-second
rpm = revolutions per minute
ft-c = foot-candle
atm = atmosphere

sq = square
cu = cubic

wt = weight
lb = pound
g = gram
kg = kilogram
mg = milligram
μg = microgram
μμg = micromicrogram
mEq = milliequivalent
gr = grain
M = mole
mM = millimole
μM = micromole

L = liter
ml = milliliter
μl = microliter
I.U. = international unit
ppm = parts per million
vol % = volume percent

°C = degrees centigrade
°F = degrees Fahrenheit
cal = calorie
kcal = kilocalorie
BTU = British thermal unit

> = greater than
< = less than

Biological and Chemical Specifications

♂ = male
♀ = female
sp. = species (singular)
spp. = species (plural)
po = oral
rec = rectal
sc = subcutaneous
im = intramuscular
ip = intraperitoneal
iv = intravenous
RBC = red blood cell (erythrocyte)
WBC = white blood cell (leukocyte)
CNS = central nervous system
CSF = cerebrospinal fluid

d = *dextro* (rotatory)
l = *levo* (rotatory)
D = *dextro* (in configurational sense only)
L = *levo* (in configurational sense only)
m = meta
o = ortho
p = para
M = molar
N = normal, or *nitro*
O = *oxy*
S = *sulf* or *sulfo*
STP = standard temperature and pressure

INTRODUCTION

The *Biology Data Book* is a volume of broad scope and limited coverage designed to serve as a basic reference in the field of biology. It is a radical revision of the *Handbook of Biological Data* published in 1956 by the W. B. Saunders Company.

Much has been learned over the past eight years from users of the old handbook. In order to incorporate their suggestions for improvement, i.e., larger type, literature citations, and a detailed index, it became obvious that the number of tables to be included in the *Biology Data Book* would have to be restricted to a more discriminating selection. The Committee on Biological Handbooks assigned the task of choosing the basic tables for the new general reference book to a specially appointed *Biology Data Book* Advisory Committee. Copies of the old handbook and of the specialized volumes in the Biological Handbooks series were sent to the members of the Advisory Committee, who used these books for two years in daily work situations. On the basis of frequency of referral, the Advisory Committee selected 143 tables for extensive revision and updating, and recommended the inclusion of 12 additional tables containing data of fundamental importance and current relevance.

The space limitations affecting subject coverage also imposed restrictions on the number of species to be included in the *Biology Data Book*. The Advisory Committee approved a list of approximately 400 species, which included the more common animals and plants, certain physiologically unique forms, and the size extremes within taxonomic groups. Frequently data were not accessible for a plant or animal appearing on the list, but were available for a related form. In such cases, the information for the related organism was used in the tabulation. In the tables on toxins and parasitism, the inclusion of data was dependent on whether the victim or host, rather than the offending organism, appeared on the approved list.

The *Biology Data Book* has been organized in the form of quantitative and descriptive tables, charts, and diagrams, and arranged in 13 sections for the convenience of the user. Contents of the volume have been authenticated by 470 leading investigators in the fields of botany, zoology, and medicine. The review process to which the data have been subjected was designed to eliminate, insofar as possible, material of questionable validity and errors of transcription.

An explanatory headnote, serving as an introduction to the subject matter, may precede a table. More frequently, tables are prefaced by a short headnote containing such important information as units of measurement, abbreviations, definitions, and estimate of the range of variation. To interpret the data, reading of the related headnote is essential.

The main conventions used throughout the data book have been adapted from the *Style Manual for Biological Journals*, published in 1960 for the Conference of Biological Editors by the American Institute of Biological Sciences. The terminology has been checked against *Webster's Third New International Dictionary*, published in 1961 by G. & C. Merriam Company.

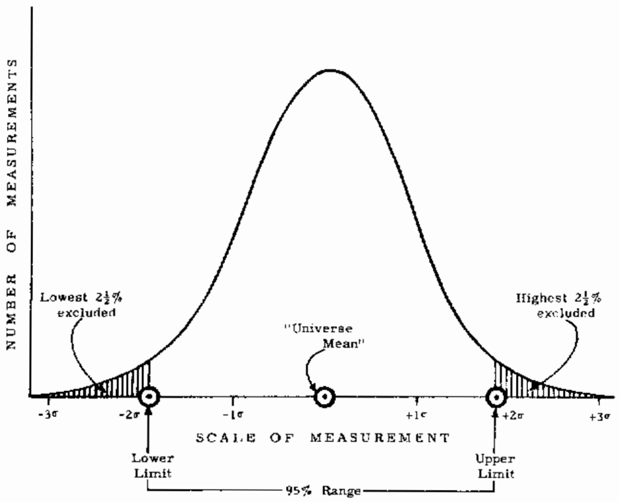
Appended to the tables are the names of the contributors, and a list of the literature citations arranged in alphabetical sequence. The reference abbreviations conform to the *1961 Chemical Abstracts List of Periodicals* published by the American Chemical Society.

It is suggested that the table of contents be used in conjunction with the index: the table of contents to determine the scope of the data for a particular topic, and the index to locate data for a specific subject or organism. To facilitate identification, the index includes the taxonomic orders for animals, and the family for plants.

. . . .

Values are generally presented as a mean and the lower and upper limit of the range of individual values about the mean. This range may be estimated in several ways, the method depending on the information available. Letter designations (a, b, c, d) identify types of ranges in descending order of accuracy.

(a) When the group of values is relatively large, a 95% range is derived by curve fitting. A recognized type of normal frequency curve is fitted to a group of measured values, and the extreme 2.5% of the area under the curve at each end is excluded *(see illustration)*.



(b) When the group of values is too small for curve fitting, as is usually the case, a 95% range is estimated by a simple statistical calculation. Assuming a normal symmetrical distribution, the standard deviation is multiplied by a factor of 2, then subtracted from and added to the mean to give the lower and upper range limits.

(c) A less dependable, but commonly applied, procedure takes as range limits the lowest value and the highest value of the reported sample group of measurements. It underestimates the 95% range for small samples and overestimates for larger sample sizes, but may be used in preference to the preceding method where there is marked asymmetry in the position of the mean within the sample range.

(d) Another estimate of the lower and upper limits of the range of variation is based on the judgment of an individual experienced in measuring the quantity in question. The trustworthiness of such limits should not be underestimated.

I. GENETICS AND CYTOLOGY

1. CHROMOSOME NUMBERS: ANIMALS

For information on additional species, consult references 2 and 26, Part I.

Part I. VERTEBRATES

Diploid (column C): s = spermatogonium; o = oogonium; m = somatic cell. **Haploid** (column D): ♂(I) = primary spermatocyte; ♂(II) = secondary spermatocyte.

	Species	Common Name	Chromosome Number		Sex Type	Reference
			Diploid	Haploid		
	(A)	(B)	(C)	(D)	(E)	(F)
	Mammalia					
1	*Homo sapiens*	Man	46s, o, m	23♂(I, II)	X-Y♂	60

			Arthropoda			
8	Arachnida	*Tegenaria domestica*	House spider	43s	23♂(I)	53
9	Merostomata	*Tachypleus tridentatus*	King crab	26s	13♂(I,II)	48
10	Crustacea	*Artemia salina*	Brine shrimp	42m	21♀(I,II)	1
11		*Astacus fluviatilis*	Crayfish	....	ca. 58♂(I)	52
12		*Cyclops viridis*	Cyclops	12o	6♀(I)	63
13		*Daphnia magna*	Water flea	20s,m	10♀(I)	40
14		*Homarus* sp.	Lobster	....	18♂(I)	31
15		*Lepas anatifera*	Goose barnacle	26s,o	13♂(I), 13♀(I)	75
16		*Potamon dehaanii*	River crab	82s	41♂(I,II)	77
17	Insecta	*Aedes albopictus*	Mosquito	6s,o	....	59
18		*Apis mellifera*	Honeybee	16o	16♂(I,II)	13,14
19		*Bombyx mori*	Silkworm	56s	28♂(I,II)	47
20		*Calliphora erythrocephala*	Bluebottle fly	12s,o	6♂(I,II)	24
21		*Cimex lectularius*	Bedbug	30-34s,33-41o	18-21♂(I)	11
22		*Ctenocephalides canis*	Dog flea	14♂m	....	25,26
23		*Drosophila melanogaster*	Fruit fly	8s,o	4♀(I)	20
24		*Dytiscus marginalis*	Diving beetle	38s	19♂(I,II)	55
25		*Ephestia kuehniella*	Mediterranean flour moth	....	30♂(I,II); 30♀(I); 29,30♀(II)	71
26		*Formica sanguinea*	Red ant	ca. 48m	24♀(I,II)	57
27		*Habrobracon juglandis*	Parasitic wasp	20o	10♀(I)	62
28		*Leptinotarsa signaticolis*	Potato beetle	34s	17♂(I); 16, 17♂(II)	74
29		*Locusta migratoria*	Migratory locust	23s	12♂(I); 11,12♂(II)	76
30		*Magicicada septendecim*	Periodical cicada	19s,20o	10♂(I); 9,10♂(II)	58
31		*Mantis religiosa*	Praying mantis	27s	13♂(I); 13,14♂(II)	27
32		*Melanoplus differentialis*	Differential grasshopper	24♀m	12♀(I,II)	60
33		*Musca domestica*	Housefly	12s,o	6♂(I,II)	65
34		*Pediculus capitis*	Head louse	12m	....	16
35		*Periplaneta americana*	American cockroach	33s, 34♀m	17♂(I); 16,17♂(II)	66
36		*Pieris brassicae*	European cabbageworm	30s,o	15♂(I,II), 15♀(I)	15
37		*Popillia japonica*	Japanese beetle	18s	9♂(I,II)	78
38		*Samia cynthia*	Cynthia moth	26s,o, ♀m	13♂(I,II), 13♀(I,II)	12
39		*Tenebrio molitor*	Yellow mealworm	20s,o, ♀m	10♂(I,II)	64
40		*Thermobia domestica*	Firebrat	34s, 36o	18♂(I); 16,18♂(II)	49
41	Onychophora	*Peripatus* sp.	Peripatus	28s,o,m	14♂(I,II)	39
			Annelida			
42	Hirudinea	*Herpobdella bistriata*	Leech	18s	9♂(II)	73
43	Oligochaeta	*Enchytraeus humicultor*	White worm	32s,o	16♀(I)	69
44		*Lumbricus terrestris*	Earthworm	36m	....	41
45	Polychaeta	*Nereis limbata*	Clam worm	20-30m	14♀(I)	3,4
			Mollusca			
46	Cephalopoda	*Sepia officinalis*	Cuttlefish	....	6♀(I)	35
47	Bivalvia	*Mactra* sp.	Bar clam	24m	12♀(I,II)	29
48		*Unio* sp.	Pearl mussel	....	16♀(I,II)	33
49	Gastropoda	*Aplysia limacina*	Sea hare	24m	....	6,7
50		*Doris bifida*	Sea lemon	32m	16♀(I,II)	61
51		*Helix pomatia*	Land snail	54s	27♂(I), 27♀(I)	50
52		*Lymnaea japonica*	Freshwater snail	36s	18♂(I)	22
			Aschelminthes			
53	Nematoda	*Ascaris lumbricoides*	Large roundworm	43s; 48o; 43, 48m	24♂(I); 19, 24♂(II); 24♀(I,II)	72
54		*Rhabditis* sp.	Free-living roundworm	13s; 14o; 13, 14m	7♂(I); 6,7♂(II); 7♀(I,II)	30
55	Rotifera	*Asplanchna intermedia*	Rotifer	24s, ♂m	12♂(I)	67
			Platyhelminthes			
56	Cestoda	*Taenia pisiformis*	Dog tapeworm	....	13-15♀(I)	70

2. CHROMOSOME NUMBERS: PLANTS

For information on additional species of plants, consult reference 2, Part I.

Part I. NONVASCULAR

Many of the chromosome numbers are of doubtful accuracy since the small size of the chromosomes makes it difficult to determine exact counts.

	Class and Species	Haploid Number	Reference
	(A)	(B)	(C)
	Myxophyta		
	Myxomyceteae		
1	*Comatricha nigra*	ca. 30	70
2	*Physarum polycephalum*	ca. 90	49
	Acrasieae		
3	*Dictyostelium discoideum*	7	76,77
	Fungi		
	Phycomycetes		
4	*Phycomyces nitens*	2	43
5		ca. 12	9
6	*Saprolegnia ferax*	7 or more	25
	Ascomycetes		
7	*Aspergillus niger*	2	71,74
8	*Neurospora crassa*	7	39,63
9		9	35
10	*Penicillium* sp.	2	13
11	*Peziza vesiculosa*	8	18,22,44
12	*Saccharomyces cerevisiae*	2	6
13		4	15
14	*Schizosaccharomyces octosporus*	4	75
	Ascomycetes		
15	*Venturia inaequalis*	4-6	5

Part II. VASCULAR

For additional information on gymnosperms and angiosperms, consult reference 18.

	Species (Common Name)	Diploid Number	Reference
	(A)	(B)	(C)
	Pteridophyta		
1	*Adiantum pedatum* (American maidenhair)	58	48
2	*Equisetum arvense* (field horsetail)	216	8
3	*Lycopodium clavatum* (club moss)	68	8
4	*Polypodium virginianum* (rock polypody)	74,148	8,48
5	*Selaginella selaginoides* (spike moss)	18	8
	Gymnospermae		
6	*Abies concolor* (white fir)	24	67
7	*Cupressus sempervirens* (Italian cypress)	22	51
8	*Ginkgo biloba* (ginkgo)	24	45
9	*Juniperus virginiana* (eastern red cedar)	22,33	74
10	*Larix occidentalis* (western larch)	24	67
11	*Picea glauca* (white spruce)	24	67
12	*Pinus palustris* (longleaf pine)	24	49
13	*Sequoia gigantea* (giant sequoia)	22	39
14	*Taxodium distichum* (bald cypress)	22	73
15	*Taxus baccata* (English yew)	24	12
16	*Thuja occidentalis* (northern white cedar)	22	67
17	*Tsuga canadensis* (eastern hemlock)	24	67
	Angiospermae (Monocotyledoneae)		
18	*Allium cepa* (garden onion)	16,32	11
19	*Asparagus officinalis* (garden asparagus)	20	55
20	*Avena sativa* (common oat)	42	22
21	*Elodea canadensis* (Canada waterweed)	48	65
22	*Gladiolus* spp.[1] (gladiolus)	30,45,60,75	2
23	*Hordeum vulgare* (barley)	14	42
24	*Iris versicolor* (blue-flag iris)	72,84,105	68
25	*Lilium* spp. (lily)	24	29,64
26	*Oryza sativa* (rice)	24	1
27	*Phleum pratense* (timothy)	42	54
28	*Phoenix dactylifera* (date palm)	36	4
29	*Poa pratensis* (Kentucky	36-123	56
30	bluegrass)	38-96	40
31	*Tradescantia virginiana* (Virginia spiderwort)	24	14
32	*Triticum aestivum* (wheat)	42	61
33	*Yucca* spp. (yucca)	60	72,82
34	*Zea mays* (corn)	20	60
	Angiospermae (Dicotyledoneae)		
35	*Acer saccharinum* (silver maple)	52	77

Part II. VASCULAR

	Species (Common Name)	Diploid Number	Reference
	(A)	(B)	(C)
	Angiospermae (Dicotyledoneae)		
36	*Alnus rubra* (red alder)	28	83
37	*Antirrhinum majus* (snapdragon)	16	59
38	*Beta vulgaris* (common beet)	18	47,84
39	*Betula lenta* (sweet birch)	28	86
40	*Capsicum frutescens* (bush red pepper)	24	69
41	*Carya tomentosa* (mockernut hickory)	64	85
42	*Catalpa speciosa* (northern catalpa)	40	70
43	*Chrysanthemum maximum* (Pyrenees chrysanthemum)	85,90,126,148, 154,160,171	21
44	*Cinchona ledgeriana* (ledger-bark cinchona)	34	19
45	*Citrus limon* (lemon)	18,36	44
46	*C. sinensis* (sweet orange)	45	44
47	*Cornus florida* (flowering dogwood)	22	20
48	*Cucumis sativus* (cucumber)	14	30
49	*Cucurbita pepo* (pumpkin)	40	10,23
50	*Daucus carota* (carrot)	18	26,31
51	*Digitalis purpurea* (common foxglove)	56	9
52	*Fagopyrum esculentum* (buckwheat)	16	36
53	*Fagus sylvatica* (European beech)	24	38
54	*Fragaria virginiana* (Virginia strawberry)	56	33
55	*Fraxinus americana* (white ash)	46,92,138	87
56	*Glycine soja* (soybean)	40	62
57	*Gossypium hirsutum* (upland cotton)	52	89
58	*Helianthus annuus* (common sunflower)	34	27
59	*Ilex aquifolium* (English holly)	40	50
60	*Ipomoea batatas* (sweet potato)	90	80
61	*Juglans nigra* (black walnut)	32	85
62	*Lactuca sativa* (lettuce)	18	79
63	*Lycopersicon esculentum* (tomato)	24	3
64	*Magnolia* spp. (magnolia)	38,76,114	34
65	*Malus pumila* (common apple)	34,51	16
66	*Medicago sativa* (alfalfa)	16	6
67		32,64	81
68	*Nicotiana tabacum* (common tobacco)	48	28
69	*Oenothera biennis* (common evening primrose)	14	16
70	*Pastinaca sativa* (parsnip)	22	57
71	*Persea americana* (American avocado)	24	7
72	*Phaseolus vulgaris* (kidney bean)	22	78
73	*Phlox* spp. (phlox)	14,21,28	24,25,53
74	*Pisum sativum* (garden pea)	14	63
75	*Populus tremuloides* (quaking aspen)	38	71
76	*Prunus amygdalus* (almond)	16	15
77	*P. domestica* (garden plum)	48	15
78	*P. persica* (peach)	16	15
79	*Pyrus communis* (pear)	34,51	17
80	*Quercus alba* (white oak)	24	75
81	*Raphanus sativus* (garden radish)	18	41
82	*Rheum officinale* (medicinal rhubarb)	22	37
83	*Rhododendron* spp. (rhododendron)	26,39,52,78, 104,156	35
84	*Ribes* spp. (currant)	16	13,52,90
85	*Rosa* spp.[1] (rose)	14,21,28	88
86	*Salix alba* (white willow)	76	5
87	*Solanum tuberosum* (potato)	48	76
88	*Trifolium pratense* (red clover)	14	46
89	*Ulmus americana* (American elm)	28	43
90		56	66
91	*Vicia faba* (broad bean)	12,14	32
92	*Vitis vinifera* (European grape)	38,57,76	58

8	Blood group Xg^a	Erythrocytes agglutinate with antiserum	Erythrocytes agglutinate with antiserum	Erythrocytes agglutinate with antiserum	24
9	Choroideremia	Night blindness, constricted visual fields, blindness	Depigmented retina	Unknown	21
	Color blindness, partial				
10	Deutan series	Red blindness	Defect in only a few	Red blindness	10
11	Protan series	Green blindness	Mild defect revealed by special tests	Green blindness	10
12	Deaf-mutism	Profound deafness at birth	Absent	Profound deafness at birth	26,32
13	Diabetes insipidus, nephrogenic	High urinary output unaffected by pitressin	Slight increase in urinary output	Unknown	40
	Dysplasia				
14	Anhidrotic ectodermal	Widespread ectodermal defects	Patchy defect	Unknown	9
15	Spondylo-epiphyseal	Dwarfism, with changes especially of spine and hips	Absent	Unknown	17
	Dystrophy				
16	Macular	Loss of central vision	Absent	Unknown	34
17	Muscular (Duchenne)	Progressive atrophy of muscles	Mild serum enzymatic changes	Unknown	7,36
18	Glucose-6-PO_4 dehydrogenase deficiency	Hemolytic anemia with drugs	Absent	Hemolytic anemia with drugs	6
19	Hemeralopia	Night blindness with myopia	Absent	Unknown	34
	Hemophilia				
20	Classical[1]	Severe bleeder	Absent	Severe bleeder	5,16,25, 33
21	Mild[2]	Mild bleeder	Slight occasional manifestation	Unknown	14
22	Hurler syndrome	Dwarfism, mucopolysaccharide deposits, mental deficiency	Absent	Unknown	22
23	Hydrocephalus, congenital	Stenosis of aqueduct of Sylvius	Absent	Unknown	11
24	Hypoparathyroidism	Low serum Ca^{++}, tetany	Absent	Unknown	27
25	Hypophosphatemia	Low serum inorganic phosphorus	Low serum inorganic phosphorus	Unknown	42
26	Ichthyosis simplex	Scaly skin	Absent	Scaly skin	9
27	Idiocy	Idiocy with microcephaly	Absent	Unknown	3
28	Keratosis follicularis (Laméris)	Multiple horny skin growths	Absent	Unknown	9
29	Lowe's syndrome	Glaucoma, mental retardation, renal tubule defect	Absent	Unknown	37
30	Megalocornea	Large cornea	Occasional manifestation	Unknown	13
31	Microphthalmia	Abnormally small eyes and blindness	Absent	Absent	28
32	Nystagmus	Severe involuntary movement of eyeball	Slight involuntary movement of eyeball	Unknown	29,34
33	Ophthalmoplegia	Paralysis of eye muscles, myopia; knee jerks absent	Knee jerks absent	Unknown	31

4. LINKAGE GROUPS: VERTEBRATES

The size or length of a linkage map reflects the extent of genetics investigation rather than the number of genes possessed by the animal. Capital letters (in columns giving Gene Symbol, Linkage, and Mutation) indicate dominant genes.

Part I. GUINEA PIG

Cavia porcellus has 32 pair of chromosomes (±1 pair), including an XY pair in males. Linkage groups have been found for 2 pair.

	Gene Symbol	Linkage	Recombination Percentage	Mutation	Phenotypic Expression	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
	Linkage Group I					
1	*R*	*R--Px*	43.8±1.6	Rough fur	Rough fur, at least on hind toes	1-4
2	*Px*	*Px--R*	43.8±1.6	Pollex	Tendency to atavistic return of thumb, little toe, and, on rare occasions, big toe	
	Linkage Group II					
3	*si*	*si--m*	21.7±5.2	silvered (stationary from birth)	Silver-coated fur; incomplete recessive	5
4	*m*	*m--si*	21.7±5.2	modifier	Modifies rough fur effect; homozygote high-grade roughness

Part II. MOUSE

Mus musculus has 20 pair of chromosomes; linkage groups have been found for 19 pair.

	Gene Symbol	Linkage	Recombination Percentage	Mutation	Phenotypic Expression	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
	Linkage Group I					
1	*fr*	*fr--sh-1*	16	frizzy	Fine thin hair, curled vibrissae	31
2	*ol*[1]	*ol--c*	17	oligodactyly	Reduced number of digits	48
3	*H-1*	*H-1--c*	7	Histocompatibility-1	Susceptibility to tissue transplants	91,93
4	*Hb*[1]	*Hb--c*	5[2], 2[3]	Hemoglobin pattern	Electrophoretic pattern of hemoglobin	76
5	*sh-1*	*sh-1--c*	4[2], 3[3]	shaker-1	Circling, head shaking, deafness	31,45,46
6	*c*	*c--p*	16[2], 12[3]	albino	Absence of pigment in hair and eyes	31,45,46, 76
7	*hf*	*c--hf*	3	hepatic fusion	Fusion of left median and left lateral lobes of liver	4
8	*tp*	*tp--p*	5	taupe	Reduced pigment in coat	79
9	*H-4*[1]	*H-4--p*	0	Histocompatibility-4	Susceptibility to tissue transplants	93
10	*p*	*hf--p*	13	pink-eyed dilution	Pink eyes, reduced black or brown pigment	4
11	*qv*	*p--qv*	12	quivering	Locomotor instability, pronounced trembling in adults, priapism in old males	103
12	*da*	*p--da*	17	dark	Darkens back of agouti or yellow mice	28
13	*pu*	*p--pu*	22	pudgy	Tail short or absent, torso shortened	81
	Linkage Group II					
14	*lu*	*lu--dse*	17	luxoid	Tibial hemimelia and preaxial polydactyly	44
15	*d*	*d--se*	0.1	dilute	Clumped pigment granules in hair	39
16	*se*[1]	*dse--du*	20	short ear	Reduced cartilaginous skeleton	44,90

/1/ Listed order not established. /2/ For heterozygous females. /3/ For heterozygous males.

Part II. MOUSE

	Gene Symbol	Linkage	Recombination Percentage	Mutation	Phenotypic Expression	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
				Linkage Group II		
17	*sv*[1]	*se--sv*	1	Snell's waltzer (recessive)	Circling, head shaking	43
18	*tk*[1]	*dse--tk*	11	tail kinks	Kinky tail, abnormal cervical and upper thoracic vertebrae	29
19	*du*	*du--dse*	20	ducky	Waddling gait	44,90
				Linkage Group III		
20	*pn*	*pn--s*	30	pugnose	Frontal and nasal bones short and wide	53
21	*s*[4]	*s--hr*	8	piebald	Unpigmented areas of fur	87
22	*ag*[1]	*ag--hr*	0	agitans	Impaired locomotion, tremor, death at 3-4 wk	49
23	*hr*	*hr--W*	42	hairless	Hair shed beginning at 10-14 da	38
24	*wl*[1,5]	*hr--wl*	4	wabbler-lethal	Impaired locomotion, death at 3-4 wk	59
25	*pi*	*hr--pi*	36	pirouette	Circling, head shaking, deafness	18
26	*W*	*pi--W*	7	Dominant spotting	White spotting and dilution of coat color, macrocytic anemia, sterility	17
27	*Ph*[1]	*W--Ph*	0.1	Patch	White spotting	47
28	*le*[1]	*W--le*	12	light ears	Dilution of coat color	58
29	*lx*	*W--lx*	18	luxate	Tibial hemimelia, preaxial polydactyly	7
30	*rl*	*lx--rl*	16	reeler	Impaired locomotion, death at 3-4 wk	24
				Linkage Group IV		
31	*r*	*r--si*	15	rodless retina	Absence of rods	52
32	*si*	*si--pg*	close	silvered	Absence or reduction of pigment in coat	30
33	*pg*[1]	*pg--si*	close	pigmy	Small size	30
34	*av*[1]	*si--av*	33	Ames' waltzer (recessive)	Circling, head shaking	83
				Linkage Group V		
35	*Ra*	*Ra--a*	22	Ragged	Thin coat	11,60,72
36	*Op*	*Op--a*	27	Opossum	Very thin coat; probably an allele of *Ra*	40
37	*H-3*[1]	*H-3--a*	10	Histocompatibility-3	Susceptibility to tissue transplants	91
38	*kr*	*kr--a*	1	Kreisler (recessive)	Circling, head shaking, deafness	48,58
39	*bp*	*bp--a*	0.3	brachypodism	Short feet	77
40	*a*	*a--un*	5	non-agouti	Removes yellow band from hairs	5,35
41	*un*	*un--we*	7[2], 5[3]	undulated	Wavy tail and abnormal vertebral column	26,35
42	*we*	*we--pa*	4[2], 2[3]	wellhaarig	Wavy coat and vibrissae	26,35,58
43	*mg*[1]	*a--mg*	13[2], 10[3]	mahogany	Dark coat, especially ears and tail	60
44	*pa*	*pa--ro*	1	pallid	Pink eyes, reduction of pigment in coat, frequent absence of otoliths	26
45	*ro*	*a--fi*	36[2], 27[3]	rough	Air spaces in hair abnormal, waved vibrissae	9,97
46	*dm*[1]	*a--dm*	13	diminutive	Small size, malformed vertebrae and ribs	95
47	*fi*	*pa--fi*	19	fidget	Circling, head shaking, occasional polydactyly	6
48	*Sd*	*fi--Sd*	22	Danforth's short tail	Short tail, urogenital abnormalities	97
				Linkage Group VI		
49	*N*	*N--Ca*	1[2], 3[3]	Naked	Hair breaks off near skin level	12,66,69
50	*Ca*	*Ca--bt*	4[2], 11[3]	Caracul	Wavy coat and vibrissae	66,69
51	*hl*	*Ca--hl*	2[2], 6[3]	hair-loss	Loses hair, usually naked by 2-3 mo	50
52	*Ht*[1]	*Ca--Ht*	2[2], 3[3]	High tail	Tail emerges high, short and thick at base, not kinked	80,81
53	*bt*	*hl--bt*	9	belted	White belt	50
				Linkage Group VII		
54	*Re*	*Re--Al*	7	Rex	Wavy coat and vibrissae	14,58
55	*Al*	*Al--sh-2*	21	Alopecia	Hair thin and patchy beginning at 1 or 2 mo	58
56	*ti*[1,6]	*Re--ti*	20[2], 21[3]	tipsy	Muscular incoordination, rabbit-like gait	84
57	*Tr*[7]	*Re--Tr*	23	Trembler	Convulsions in young, head trembling in adults	32

/1/ Listed order not established. /2/ For heterozygous females. /3/ For heterozygous males. /4/ *s--W* recombination, 47% [33]. /5/ *wl--W* recombination, 43% [59]. /6/ *ti--vt* recombination, 9% [84]. /7/ *Tr--sh-2* recombination, 3% [32].

Part IV. RAT

Rattus norvegicus has 21 pair of chromosomes; linkage groups have been found for 5 pair. Seven genes have been found to be independent of linkage groups I-V, and of each other, and are provisionally regarded as markers of 7 additional chromosome pair: jaundice *(j)*, curly coat *(*Cu_2*)*, cataract *(Ca)*, blue dilution of coat *(d)*, hooded coat pattern *(h)*, cowlick *(cw)*, and shaker *(sr)*. [3, 5, 6, 9, 10]

	Gene Symbol	Locus	Mutation	Phenotypic Expression	Reference
	(A)	(B)	(C)	(D)	(E)
				Linkage Group I	
1	*p*	0	pink eye	Coat yellow, eyes pink	1, 2, 7, 14
2	*r*	20.5	red-eyed yellow	Coat yellow, eyes red	
3	*c*	21	albinism	Absence of pigment from coat and eyes	
4	*l*	24.3	lethal	Skeletal abnormalities	
5	*w*	66.3	waltzing	Runs in circles	
				Linkage Group II	
6	*Sh*	0	Shaggy	Hair and vibrissae curved	2, 7-9, 13
7	*Cu*	4	Curly	Hairs of coat and vibrissae curved

5. LINKAGE GROUPS: INVERTEBRATES

The size or length of a linkage map reflects the extent of genetics investigation rather than the number of genes possessed by the insect. Capital letters (in columns giving Gene Symbol, Linkage, and Mutation) indicate dominant genes.

Part I. FRUIT FLY

Drosophila melanogaster has 4 pair of chromosomes; linkage groups have been found for all 4 pair. For information on other species of *Drosophila*, consult the following references: *D. affinis* [30, 39], *D. ananassae* [17, 25-27, 30], *D. hydei* [32-34], *D. montium* [28, 29], *D. persimilis* [10, 18, 35], *D. prosaltans* [31], *D. pseudoobscura* [24, 30, 39, 42], *D. similans* [30, 38, 41], *D. subobscura* [2, 6-9, 13-16, 21-23, 36, 37], *D. virilis* [3-5, 19, 30], *D. willistoni* [12, 20]. **Gene Symbol** (column A): *l̲* = lethal; *1* = the number one; *l* = the letter 1. **Locus** (column B): (Dp) = duplication; (Df) = deficiency. A number of loci have recently proved to be pseudoallelic (show crossing over with low frequency within subdivisions of an individual locus); such loci are indicated in column C as (pseudo).

	Gene Symbol	Locus	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)
	X Chromosome [11, 43]			
1	*l(1)Jl*	0	lethal (1) Jacobs-Muller	Almost completely lethal; survivors scute, sterile
2	*l(1)55a*	0-	lethal (1) 55a	Lethal, heterozygote hyperviable
3	*su-w^a*	0-	suppressor of apricot	w^a eye color made to resemble w^{co}
4	*y*	0	yellow	Body yellow; bristles and hairs yellow or brown in different alleles
5	*brc*	0	brachymacrochaete	Macrochaetes reduced

5. LINKAGE GROUPS: INVERTEBRATES

Part I. FRUIT FLY

	Gene Symbol	Locus	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)
	X Chromosome [11,43]			
6	*ac*	0+	achaete	Postdorsocentrals missing; intraocular and eye hairs fewer
7	*Hw*	0+ (Dp)	Hairy-wing	Extra bristles along wing veins, on head and thorax
8	*sc*	0+	scute	Scutellar bristles missing, others missing or reduced
9	*svr*	0+	silver	Body silvery, bristles dark
10	*su-s*	0+	suppressor of sable	Suppresses *s* and *v*
11	*dor*	0+	deep orange	Eyes orange; female sterile
12	*l(1)7e*	0+	lethal (1) 7e	Dies in larval stage
13	*saw*	0+	sawtooth	Wing hairs serrated
14	*su-b*	0.1	suppressor of black	Suppresses *b*
15	*om*	0.1±	ommatidia	Eyes slightly rough
16	*M(1)Bld*	0.1+ (Df)	Minute (1) Blond	Extreme minute (small bristles, low viability, homozygous lethal)
17	*l(1)7*	0.3	lethal (1) 7	Dies as late larva; tumors present
18	*fla*	0.3±	flat eye	Eyes small, flat
19	*sta*	0.3±	stubarista	Antennae and aristae short, bristles reduced, eye rotated
20	*tw*	0.4±	twisted	Abdomen twisted counterclockwise
21	*mwi*	0.4±	misheld wings	Wings divergent, upheld; eyes oval
22	*uq*	0.5±	unequal wings	Wings short, often unequal
23	*kz*	0.7	kurz	Bristles short, fine; postscutellars often absent
24	*rey*	0.7±	rough eye	Eyes small, rough
25	*pn*	0.8	prune	Eyes brownish, darkening with age, often mottled
26	*mk*	0.8±	murky	Body and eyes dark; female sterile
27	*gt*	0.9	giant	Giant larva, pupa, adult; variable
28	*rsc*	0.9±	reduplicated sex combs	Sex combs on all six legs of male
29	*fc*	0.9±	faulty chaete	Bristles short, thin; some absent
30	*ovi*	0.9±	ovioculus	Eyes small, egg-shaped; male sterile
31	*z*	1.0	zeste	Eyes yellow in female at 25°C; temperature-sensitive; interacts with *w* alleles
32	*fb*	1.0±	fine bristle	Bristles short, fine
33	*l(1)ml*	1.0	lethal (1) melanomalike	Dies as late larva, melanotic inclusions
34	*bsc*	1.1	bent scutellars	Scutellars and other bristles often bent
35	*mis*	1.3±	misproportioned	Abdomen abnormal in shape and size
36	*w*	1.5	white (pseudo)	White eyes, ocelli, testes, malpighian tubes
37	rst^2	1.7	roughest^2	Eyes rough, body dwarfed, some bristles reduced
38	*To*	2.3-	Tousled	Thoracic bristles disarranged, duplicated
39	*Co*	3.0± (Dp)	Confluens	Wing veins thick, with deltas
40	*nd*	3.0±	notchoid (pseudo with *spl-fa-N*)	Eyes small, wings notched
41	*spl*	3.0±	split (pseudo with *spl-fa-N*)	Eyes rough, small; bristles often split or missing
42	*fa*	3.0±	facet (pseudo with *spl-fa-N*)	Eyes rough, wings nicked
43	*N*	3.0± (often Df)	Notch (pseudo with *spl-fa-N*)	Wings notched; male lethal
44	*Ax*	3.0±	Abruptex	Wings short, veins incomplete; thorax with mid-furrow
45	*rud*	3.3±	ruddle	Eyes reddish brown
46	*slc*	3.6±	slim chaete	Bristles fine, short
47	*Sc*	4.0±	Scotched eye	Ommatidia disarranged; male lethal
48	*dm*	4.6	diminutive	Body and bristles small; female sterile
49	*M(1)3E*	5.0±	Minute (1) 3E	Slight minute (body small, bristles fine, homozygous lethal)
50	su^x*-dx*	5.0±	suppressor of deltex	*dx* made nearly +; male fertile
51	*ec*	5.5	echinus	Eyes rough, large; facets large
52	*mf*	5.5±	macrofine	Body small, macrochaetes fine
53	*te*	5.6±	tenuchaete	Bristles fine, short; eyes dark
54	*Oc*	5.7±	Ocellarless	One or both ocellar bristles missing
55	*mo*	6.7±	microoculus	Eyes small, wings narrow
56	*amb*	6.8±	amber	Body pale yellow, bristles reduced; male sterile
57	*bi*	6.9	bifid	Wing veins fused into bifid stalk
58	*M(1)4BC*	7.0±	Minute (1) at 4BC	Strong minute (body small, bristles fine, homozygous lethal)
59	*peb*	7.3±	pebbled	Eyes slightly roughened
60	*lac*	7.3±	lacquered	Body color light, glistening; eyes small
61	*rb*	7.5	ruby	Eyes clear ruby, darkening to garnet

Part I. FRUIT FLY

	Gene Symbol (A)	Locus (B)	Mutation (C)	Phenotypic Expression (D)
			X Chromosome [11,43]	
62	*dow*	8.0	downy	Bristles fuzzy; male sterile
63	*rg*	11.0	rugose	Eyes rough; wings thin, frayed
64	*bo*	12.5	bordeaux	Eyes dark wine
65	*omm*	12.8	ommatoreductum	Peripheral ommatidia absent, giving rough eye; head, thorax abnormal
66	*cx*	13.6	curlex	Wings bent upward
67	*cv*	13.7	crossveinless	Crossveins absent or nearly so
68	*mur*	14.3	murrey	Eyes reddish purple; body size, bristles reduced
69	*rmp*	14.4±	rumpled	Wings unexpanded, bristles disarranged
70	*rux*	15.0	roughex	Eyes small, rough
71	*Ext*	15.2±	Extras	Wing veins thickened, extra veins present
72	*vs*	16.3	vesiculated	Wings warped, divergent, blistered
73	*dx*	17.0	deltex	Wings thickened and with deltas
74	*ov*	17.5	oval	Eyes oval and rough
75	*tmc*	17.5±	tonomacrochaetes	Macrochaetes thin; abdomen pale
76	shf^2	17.9	shifted^2	Wing veins shifted closer together
77	*cm*	18.9	carmine	Eyes dark ruby
78	*scp*	19.3	scooped	Wings upturned, warped
79	*bis*	19.8± (Df)	bistre	Eyes and ocelli dark brown; male sterile
80	*ct*	20.0	cut	Wings cut to points, scalloped
81	*sn*	21.0	singed (pseudo)	Bristles and hairs curled; female sterile
82	*l(1)mys*	21.7	lethal (1) myospheroid	Dies as embryo with spheroid muscles
83	*ha*	22.7±	hair bristles	Bristles fine, short; fly small
84	*oc*	23.1	ocelliless	Ocelli absent; female sterile
85	*pam*	23.1	platinum	Male body and bristles almost colorless, bristle bases dark; sterile
86	gg^2	23.1±	goggle^2	Eyes bulging, head bristles fewer
87	*ptg*	23.2	pentagon	Thoracic trident and scutellar spot dark
88	*ccw*	23.4±	concave wing	Wings reduced, concave
89	*ch-b*	23.8	chilblained-b	Tarsi conglutinated
90	*tbd*	25.0±	tiny-bristloid	Bristles medium-fine; fly small; viability good
91	*Lg*	27.0±	Large	Body large; late-hatching
92	dd^2	27.2	displaced^2	Antennae sunken; eyes and head deformed
93	*t*	27.5	tan	Body yellowish, antennae light yellow
94	*amx*	27.7-	almondex	Eyes narrow, rough; female sterile
95	*lz*	27.7	lozenge (pseudo)	Eyes narrow, facets abnormal; female usually sterile
96	*tar*	27.7±	tarry	Femur and tibia blackened
97	*dvr*	28.1	divers	Wings short, dark; with *y*, wings curled
98	*sma*	29.9±	smaller	Body size reduced
99	*su-Cbx*	30.0±	suppressor of Contrabithorax	Almost completely suppresses *Cbx* effect in male
100	*tpw*	30.8±	tapered wing	Wings short, pointed at L3 vein tip
101	*flp*	31.0±	flap wings	Wings concave; eyes bulging, rough
102	*ny*	32.0±	notchy	Wing tips nicked
103	$en\text{-}w^e$	32.0±	enhancer of white-eosin	With w^e alleles, gives nearly white eyes; suppresses *f*
104	*sto*	32.5	stocky	Fly short; eyes large, pear-shaped
105	*clm*	32.6±	clumpy marginals	Marginal wing hairs clumped
106	*ras*	32.8	raspberry	Eyes dark ruby
107	*ww*	32.9±	wider-wing	Wings short, broad
108	*v*	33.0	vermilion (pseudo)	Eyes bright vermilion, ocelli colorless
109	*osh*	33.0±	outshifted	Wings short, divergent; body light tan
110	*dwx*	33.2	dwarfex	Body small, wings coarse
111	*sbr*	33.4	small bristle	Bristles small, some missing
112	*csk*	33.4±	costakink	Wings reduced, costal vein kinked
113	*bla*	33.6±	bladder-wing	Wings deformed, with bladders; male sterile
114	*m*	36.1+	miniature	Wings small, dark
115	*dy*	36.2-	dusky	Wings small, dark
116	*ty-l*	36.4	tiny-like	Bristles short, fine
117	*trb*	37.0±	thread bristle	Bristles short, fine
118	*fw*	38.3	furrowed	Eyes furrowed, scutellum short, bristles gnarled
119	*alo*	38.3±	alopecia	Microchaetes nearly absent
120	*ups*	40.8	upright scutellars	Posterior scutellars vertical
121	*som*	40.8	sombre	Body dark, eyes dull

Part I. FRUIT FLY

	Gene Symbol	Locus	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)
			X Chromosome [11, 43]	
122	*up*	41.0±	upheld	Wings held upright
123	*pun*	41.1±	puny	Fly small, late-hatching
124	*taw*	41.1±	tawny	Head and thorax dark, abdomen light
125	*wy*	41.9	wavy	Wings waved, curled upward
126	*kk*	42.0±	kinky	Bristles bent or forked
127	*s*	43.0	sable	Body dark
128	*cop*	43.3±	copper	Eyes brownish red
129	*ten*	43.9	tenuischaete	Bristles short, thin; body small
130	*g*	44.4	garnet (pseudo)	Eyes garnet pink
131	*ty*	44.5	tiny	Bristles, body small; female sterile
132	*na*	45.2	narrow abdomen	Abdomen cylindrical; female sterile
133	*shp*	47.5±	shrimp	Overall size reduction
134	*thb*	47.6±	thin bristle	Bristles thin
135	*pl*	47.9	pleated	Wings pleated longitudinally
136	*rim*	48.1±	rimy	Eyes brownish with white hairs; wings pleated
137	*sge*	48.4±	shifted genitals	Genitalia rotated
138	*thm*	48.9	thin-macros	Macrochaetes thin
139	*vb*	49.3	vibrissae	Vibrissae in tuft
140	*mgt*	49.6±	midget	Body small; late-hatching
141	*thv*	49.7±	thick vein	Wing veins thick; eyes small, dark
142	*sla*	50.0±	slimma	Body narrow
143	*sd*	51.5	scalloped	Wing margins excised
144	*exi*	51.5±	exiguous	Body small, dark
145	*tc*	51.6±	tinychaete	Bristles fine
146	*Bg*	51.6	Bag	Wings short, blunt, inflated
147	*sml*	51.9±	small thorax	Head and thorax small
148	*drw*	52.3±	droopy wing	Fly small, wings drooped; male sterile
149	*ber*	52.2±	berrytail	Abdomen narrow, with berrylike posterior protrusion bearing abnormal genitalia
150	*msc*	52.6±	melanoscutellum	Scutellum dark; eyes and wings abnormal in shape
151	*Shw*	53.3	Shaker-downheld	Legs, abdomen shake under ether; wings droop
152	*sl*	53.5	small-wing	Wings short, oblong; eyes large
153	*mc*	54.0	microchaete	Hairs irregular, bristles small
154	*un*	54.4	uneven	Eyes rough, small
155	*r9*	54.5	rudimentary9	Wings truncated; female sterile
156	*acc*	54.5+	acclinal wing	Wings upheld, sloping
157	*if3*	55.0±	inflated3	Wings inflated, veins thickened
158	*M(1)o*	56.6	Minute (1) o	Minute (bristles fine, viability low, homozygous lethal)
159	*f*	56.7	forked (pseudo)	Bristles short, gnarled
160	*B*	57.0 (Dp)	Bar	Eyes narrow bar in homozygote, kidney-shaped in heterozygote
161	*der*	57.2±	deranged	Thoracic bristles disarranged; wings upheld
162	*Sh*	58.0	Shaker	Legs, abdomen shake under light ether
163	*siw*	58.5±	side wing	Wings held parallel to sides of abdomen
164	*od*	59.2	outstretched	Wings divergent
165	*sy*	59.2	small-eye	Eyes small, rounded
166	*Bx*	59.4	Beadex	Wings excised
167	*rwg*	59.5±	reduced wings	Wings short, upheld; wing hairs disarranged
168	*fu*	59.5	fused	Wing veins fused; ocelli, ocellar bristles reduced or absent
169	*hdp*	59.6±	heldup	Wings upheld
170	*bk*	59.8±	buckled	Wings misshapen, divergent
171	*crk*	60.1±	crooked setae	Bristles disarranged, abnormal
172	*smd*	60.1±	smalloid	Body size reduced
173	*ton*	60.1±	tonochaete	Bristles short, fine
174	*meg*	61.9±	megaoculus	Eyes rough; eyes, wings abnormally shaped
175	*M(1)36f*	62.0±	Minute (1) 36f	Slight minute (bristles fine, homozygous lethal)
176	*car*	62.5	carnation	Eyes dark ruby
177	*M(1)n*	62.7	Minute (1) n	Minute type (fine bristles, low viability, homozygous lethal)
178	*fo*	63.0±	folded	Wings unexpanded
179	*kno*	63.9±	knobbyhead	Head small, abnormal; male infertile
180	*sw*	64.0	short-wing	Wings trimmed, warped; eyes reduced, rough
181	*su-f*	64.0±	suppressor of forked	Certain *f* alleles made nearly +

continued

Part I. FRUIT FLY

	Gene Symbol	Locus	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)
	X Chromosome [11,43]			
182	*mel*	64.1±	melanized	Body slightly dark, eyes dull red
183	*wa-l*	64.4±	warty-like	Ommatidia disarranged
184	*ot*	65.1±	outheld	Wings held out; male inviable, sterile
185	bb^5 (called *bb*)	66.0	bobbed	Bristles small, sclerites irregular
	Chromosome II [1]			
186	*net*	0-	net	Extreme plexus venation
187	*al*	0	aristaless	Aristae reduced, scutellars divergent
188	*l(2)gl*	0±	lethal (2) giant larva	Larval lethal
189	*ocr*	0	ochracea	Eye color light, darkening with age
190	*ex*	0.1	expanded	Wings broad, spread; eyes rough
191	*ds*	0.3	dachsous	Wings shorter, crossveins closer
192	*S*	1.3	Star (pseudo)	Eyes small, rough; homozygous lethal
193	*Su-S*	1.3±	Suppressor of Star	Suppresses *S*; *Su-S/S* is +
194	*ast*	1.3±	asteroid	Eyes small, rough
195	*shr*	2.3±	shrunken	Body small, wizened
196	*shv*	3.8±	short vein	Constant terminal gaps in veins L2 and L4
197	*ho*	4.0	heldout	Wings extended
198	*fes*	5.0±	female-sterile	Eggs do not develop
199	*E-S*	6.0±	Enhancer of Star	Increases expression of *S*
200	*Cy*	7.0	Curly	Wings curled upward; homozygous lethal
201	*l(2)ay*	8.3	lethal (2) ay	Lethal
202	*Dt*	10.0±	Detached	Vein L2 does not reach margin
203	*ang*	10.5	angle wing	Wings held up from dorsal surface
204	*ed*	11.0	echinoid	Eyes large, rough
205	*M(2)C*	11.0-12.0 (Df)	Minute (2) Curry	Fairly strong minute
206	*ft*	12.0	fat	Body short, fat; scutellar bristles far apart
207	*G*	12.0	Gull	Wings large, spread; homozygous lethal
208	*M(2)z*	12.9±	Minute (2) z	Medium minute
209	*M(2)B*	13.0 (Df)	Minute (2) Bridges	Medium minute
210	*dp*	13.0	dumpy	Wings truncated; vortices on thorax
211	*dw-24F*	13.0±	dwarf in 24F	Eyes dull, body dwarfed
212	*M(2)S1*	15.0	Minute (2) Schultz' 1	Strong minute
213	*l(2)cg*	15.0±	lethal (2) comb-gap	Lethal from *cg* stock
214	*Sk*	16.0	Streak	Central streak on thorax; homozygous lethal
215	*tkv*	16.0±	thick-veins	Veins thick, irregular
216	*cl*	16.5	clot	Eye color maroon, close to sepia *(se)*; male sterile
217	*pi*	17.0±	pied	Facets jumbled
218	*Sp*	22.0	Sternopleural	Extra sternopleural bristles; homozygous lethal
219	*spd*	22.3±	spade	Wings shortened, broad
220	*gt-4*	24.0	giant-4	Giant fly
221	*d*	31.0	dachs	Tarsi 4-jointed, venation shifted
222	*fy*	33.0±	fuzzy	Thoracic hairs fuzzy
223	*fol*	39.0±	folded wings	Wings folded; overlap
224	*da*	39.3±	daughterless	Homozygous female produces no daughters
225	*J*	41.0	Jammed	Wing narrow strip
226	*M(2)S11*	43.0±	Minute (2) Schultz' 11	Slight minute
227	*ab*	44.0	abrupt	Shortened L5 vein, scutellars few
228	*oph*	45.0±	ophthalmopedia	Eyes kidney-shaped or with appendage
229	*rk*	46.0±	rickets	Segments of legs flattened and bent
230	*l(2)bs^3-d*	46.0±	lethal (2) with bs^3-d	Lethal
231	*M(2)e*	46.0±	Minute (2) e	Medium minute
232	*b*	48.5	black	Body, legs, veins black
233	*j*	48.7	jaunty	Wings upturned
234	*el*	50.0	elbow	Wings bent, alulae and balancers small
235	*lm*	50.0±	limited	Sternites small; female sterile
236	*M(2)S13*	50.0±	Minute (2) Schultz' 13	Strong minute
237	*l(2)H*	50.0±	lethal (2) Humphrey	Pupal semilethal
238	*Su-H*	50.5	Suppressor of Hairless	Homozygous lethal
239	*rd*	51.0	reduced	Bristles small, irregular; female sterile
240	*pu*	51.0±	pupal	Wings unexpanded

	Gene Symbol	Locus	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)
	Chromosome II [1]			
241	*pys*	52.0±	polychaetous	Extra and double bristles
242	*cr-u*	52.5±	cream-underscored	Specific dilutor of w^e and Pale; male sterile
243	*nub*	53.0	nubbin	Wings very small and thin with tendency to curve up or down
244	*ck*	53.0±	crinkled	Wings flimsy
245	*rdo*	53.0±	reduced ocelli	Ocelli reduced in size, color moved to region between ocelli
246	*l(2)Bld*	53.1	lethal (2) opposite T(1,2) Bld	Lethal
247	*M(2)S5*	53.5	Minute (2) Schultz' 5	Medium minute
248	*hk*	53.9	hook	Bristles bent or barbed
249	*bri*	54.3±	bright	Eye color bright red
250	*pr*	54.5	purple	Eye color purplish ruby
251	*rn*	54.5±	rotund	Wings round, tarsi 3-jointed; sterile
252	*rh*	54.7±	roughish	Eyes moderately rough
253	*Bl*	54.8	Bristle	Bristles short, beaded; homozygous semilethal
254	*Alu*	54.9	Alula	Alula fused to wing; wing warped
255	*Jag*	54.9	Jagged	Wings nicked, eyes rough
256	*lt*	55.0-	light	Eye color yellowish pink
257	*tri*	55.0±	trident	Thorax darkened
258	*M(2)D*	55.0± (Df)	Minute (2) D	Body color and bristles pale
259	*rl*	55.1-	rolled	Wing edges rolled, frayed
260	*M(2)S2*	55.1 (Df)	Minute (2) Schultz' 2	Minute type
261	*M(2)S4*	55.1 (Df)	Minute (2) Schultz' 4	Medium minute
262	*M(2)S8*	55.1 (Df)	Minute (2) Schultz' 8	Slight minute
263	*M(2)S10*	55.1 (Df)	Minute (2) Schultz' 10	Slight minute
264	*stw*	55.1	straw	Body, wings, bristles yellow
265	*blt*	55.2±	blot	Wings inflated, blackened
266	*Cu*	55.2±	Curl	Lateral compression and indentation-fold of unfolded imaginal wing
267	*tk*	55.3	thick	Legs, tarsi thickened; wings short
268	*pk*	55.3	prickle	Bristles, hairs irregular
269	*ap*	55.4	apterous	Wings, balancers missing
270	*msf*	55.6-	misformed	Eyes misformed, wings crumpled
271	*bur*	55.7±	burgundy	Dull, darkish-brown eye color
272	*ti*	55.9	tarsi irregular	Tarsal segments fused, eyes rough
273	*ltd*	56.0±	lightoid	Eye color translucent yellowish pink, ocelli colorless
274	*M(2)S12*	56.0±	Minute (2) Schultz' 12	Slight minute
275	*std*	56.5±	staroid	Eyes small, very rough; male sterile
276	*ta*	56.6±	tapered	Wings narrow and pointed, veins close
277	*dil*	57.0±	specific dilutor	Dilutor of *bw* and *w* alleles
278	*buo*	57.1	burnt orange	Eye color orange brown
279	*M(2)38b*	57.0±	Minute (2) 38b	Extreme minute
280	*cn*	57.5	cinnabar	Eye color bright scarlet, ocelli colorless
281	*puf*	58.0±	puff	Wings blistered
282	*blo*	58.5	bloated	Wings ballooned, extra veins
283	*smk*	58.6±	smoky	Body color dark
284	*Np*	58.7-60.2 (Df)	Notopleural	Bristles short, wings broad; homozygous lethal
285	*at*	60.1±	arctus oculus	Number of facets reduced
286	*arch*	60.5±	arch	Wings downcurved in both axes
287	*ad*	60.7	arcoid	Wings arched, broad, short; crossveins close
288	*chl*	60.8	chaetelle	Bristles very small, slight plexus
289	*whd*	61.0±	withered	Wings warped or shrunken
290	*tom*	61.5±	tomboy	Homozygous female with male-like pigmentation of posterior tergites
291	*en*	62.0	engrailed	Scutellar notch, broken veins, extra sex comb
292	*upw*	62.0±	upward	Wings upturned
293	*l(2)rn*	63.0±	lethal (2) with rotund	Lethal
294	*Bkd*	65.0±	Blackoid	Dark body color
295	*M(2)40c*	65.0±	Minute (2) 40c	Minute type
296	*po*	65.2	pale-ocelli	Ocelli nearly colorless
297	*sca*	66.7	scabrous	Eyes rough, some bristles missing
298	*vg*	67.0	vestigial	Wings, balancers vestigial
299	*l(2)C*	67.0	lethal (2) Curry	Lethal before pupal stage

Part 1. FRUIT FLY

	Gene Symbol	Locus	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)
			Chromosome II [1]	
300	*wx*	69.7	waxy	Wings heavy, waxy; male sterile
301	*U*^{H20}	70.0±	Upturned H20	Wings curled
302	*l(2)mr*^{2}	70.0±	lethal (2) with morula^2	Lethal
303	*Pfd*	70.8	Pufdi	Wings puffed, divergent; homozygous lethal
304	*bat*	71.0	bat	Wings extended, bent back
305	*cg*	71.1	comb-gap	Sex combs large; gap in wing vein L4; female sterile
306	*dr*	71.2±	droopy	Wings spread wide apart and drooping
307	*sf*	71.5±	safranin	Eye color dark chocolate
308	*L*	72.0	Lobe	Eyes small, nicked at anterior edge
309	*kn*	72.3	knot	Veins L3 and L4 close; eyes oblique
310	*ch*	72.5	chubby	Larva, pupa, adult short
311	*dke*	73.0±	dark eye	Eye color soft, dark, dull, with tiny fleck
312	*gp*	74.0±	gap	Vein L4 broken
313	*c*	75.5	curved	Wings thin, spread, lifted, curved
314	*Wr*	76.0±	Wrinkled	Wings wrinkled; suppresses *L*
315	*M(2)S7*	77.5	Minute (2) Schultz' 7	Strong minute
316	*pw-c*	79.0±	pink-wing-c	Eye color dilute, wings short, blunt
317	*fr*	80.0±	fringed	Wing margins ragged
318	*fj*	81.0±	four-jointed	Tarsi 4-jointed; wings short
319	*rf*	81.0±	roof wings	Wings drooped at sides
320	*wt*	82.0±	welt	Eyes seamed, reduced
321	*abr*	83.0±	abero	Abdominal bands irregular; wings frayed, eyes rough; female sterile
322	*nw*	83.0±	narrow	Wings narrow
323	*I-f*	86.5	Intensifier of forked	Enhances *f*
324	*sm*	91.5	smooth	Abdomen hairless; sterile
325	*M(2)173*	92.3	Minute (2) 173	Moderate minute
326	*hy*	93.3	humpy	Thorax ridged, wings truncated
327	*l(2)Su-H*	99.0±	lethal (2) from Suppressor of Hairless	Lethal
328	*a*	99.2	arc	Wings broad, bent down, crossveins closer
329	*M(2)l*	99.0-102.2 (Df)	Minute (2) 1	Extreme minute
330	*px*	100.5	plexus	Network of extra veins
331	*pa*	101.0±	patulous	Wings spread wide apart
332	*M(2)l*^{2}	101.2	Minute (2) 1^2	Slight minute
333	*hv*	104.0	heavy vein	Veins thick, posterior crossveins oblique
334	*l(2)bw*	104.0±	lethal (2) brown	Probable deficiency; lethal
335	*bw*	104.5	brown	Eye color brownish to garnet
336	*mi*	104.7	minus	Bristles hairlike; body small; female sterile
337	*abb*	105.5	abbreviated	Bristles slightly reduced
338	*slt*	106.3	slight	Body small, bristles reduced; female sterile
339	*pd*	106.4	purpleoid	Eye color dark pink, like purple *(pr)*
340	*ll*	106.7	lanceolate	Wings narrow, pointed
341	*mr*	106.7±	morula	Eyes rough, bristles small; female sterile
342	*l(2)ax*	106.9	lethal (2) ax	Very early larval lethal
343	*sp*	107.0	speck	Black speck in wing axil; body color olive
344	*or*	107.2	orange	Bright orange eye color
345	*Px*	107.0-107.4 (Df)	Plexate	Venation as in blistered mutation *(bs)*; veins thickened, broken; homozygous lethal
346	*bs*	107.3	blistered	Wings blistered, small; extra veins
347	*Pin*	107.3±	Pin	Thoracic bristles pinlike
348	*ba*	107.4	balloon	Wings inflated, extra veins
349	*M(2)33a*	108.0± (Df)	Minute (2) 33a	Strong minute
			Chromosome III [1]	
350	*ru*	0	roughoid	Eyes small, rough; erupted facets
351	*mp*	0	microptera	Wings small, ballooned; tarsi 4-jointed
352	*aa*	0±	anarista	Aristae small, without branches
353	*ve*	0.2	veinlet	Longitudinal wing veins interrupted
354	*R*	1.4	Roughened	Eyes rough; homozygous semilethal
355	*rai*	17.0±	raisin	Deep brown eye color
356	*jv*	19.2	javelin	Bristles and hairs cylindrical
357	*dv*	20.0	divergent	Wings spread

continued

5. LINKAGE GROUPS: INVERTEBRATES

Part I. FRUIT FLY

	Gene Symbol (A)	Locus (B)	Mutation (C)	Phenotypic Expression (D)
				Chromosome III [1]
358	*Me*	20.0±	Moire	Eye color brownish, 7 flecks; homozygous lethal
359	*Hn*	23.0	Henna	Eye color dull, dark; homozygous lethal
360	*be-3*	25.0±	benign tumor in 3	Nonlethal melanotic tumors
361	*se*	26.0	sepia	Eye color brownish red, darkening to black
362	*su-t*	26.0±	suppressor of tan	Converts *t* to +
363	*h*	26.5	hairy	Extra hairs on scutellars, veins, pleurae, and head
364	*abd*	27.0±	abdominal	Abdominal bands broken, etched
365	*rs*	35.0	rose	Eye color translucent pink
366	*eyg*	35.5	eye-gone	Eyes and head reduced
367	*gv*	36.2	grooved	Longitudinal medial groove in thorax
368	*cr-3*	36.5±	cream in 3	Specific dilutor of w^e eye color
369	*rt*	37.0±	rotated	Abdomen twisted counterclockwise
370	*app*	37.5	approximated	Crossveins close; tarsi 4-jointed
371	*pyd*	39.0±	polychaetoid	Extra bristles
372	*M(3)S37*	39.7±	Minute (3) Schultz' 37	Extreme minute
373	*tt*	40.0	tilt	Wings spread, warped, with gap in vein L3
374	*M(3)33j*	40.2 (Df)	Minute (3) 33j	Medium minute
375	*M(3)h*	40.2	Minute (3) h	Medium minute; allele of *M(3)33j*
376	*M(3)y*	40.2	Minute (3) y	Medium minute; allele of *M(3)33j*
377	*vo-3*	40.4±	vortex in 3	Intensifier of dp^v
378	*D*	40.4+	Dichaete	Wings spread; homozygous lethal
379	*Ly*	40.5 (Df)	Lyra	Wings cut, narrow; homozygous lethal
380	*Gl*	41.4	Glued	Eyes small, facets rounded; homozygous lethal
381	*fz*	41.7±	frizzled	Thoracic hairs, bristles turn toward midline
382	*rp*	41.7±	rotated-penis	Male genitalia rotated; male sterile
383	*wk*	42.0±	weak	Bristles weak, irregular; body small
384	*Wi*	43.0	Washed eye	Modified *w;* homozygous lethal
385	*th*	43.2	thread	Aristae threadlike, without branches
386	*mb*	43.4±	minusbar	Modified *B* to larger eye
387	*Cm*	43.5±	Crimp	Posterior wing edge crimped; homozygous lethal
388	*bul*	43.6	bulge	Eyes bulging, wings squared off
389	*M(3)S38*	44.0±	Minute (3) Schultz' 38	Strong minute
390	*st*	44.0	scarlet	Eye color scarlet, ocelli white
391	*tra*	45.0±	transformed	Transforms female to normal-appearing male
392	*cp*	45.3	clipped	Wing margins clipped
393	*mot-28*	46.0	mottled-28	Eyes mottled with brown
394	*W*	46.0	Wrinkled	Wings incompletely unfolded, pebbled
395	*as*	46.0±	ascute	Wings held downward
396	*je*	46.0±	jelly	Eye color dark pinkish
397	*Pdr*	46.0±	Purpleoider	Intensifier of *pd*
398	*in*	46.9	inturned	Thoracic bristles directed toward midline
399	*M(3)S39*	47.0±	Minute (3) Schultz' 39	Strong minute
400	*dn*	47.0±	doughnut	Eye of *se dn* with light central spot; male sterile
401	*ri*	47.1	radius incompletus	Vein L2 shows gap
402	*eg*	47.3	eagle	Wings spread, raised
403	*Dfd*	47.5	Deformed	Eyes small; homozygous lethal
404	*wp*	47.5	warped	Wings spread, doubly warped
405	*pb*	47.7	proboscipedia	Mouth parts footlike; adult lethal; female sterile
406	*p*	48.0	pink	Eye color dull ruby
407	*Bb*	48.0±	Bubble	Wings small, inflated; male sterile; homozygous female lethal
408	*bod*	48.3	bowed	Wings arched
409	*tet*	48.5	tetraltera	Wings haltere-like
410	*by*	48.7	blistery	Wings blistered distally
411	*M(3)S34*	49.0±	Minute (3) Schultz' 34	Slight minute
412	*ma*	49.7	maroon	Eye color dull ruby
413	*cu*	50.0	curled	Wings upcurved, body dark, postscutellars crossed
414	*M(3)S31*	50.0 (Df)	Minute (3) Schultz' 31	Medium minute
415	*mu*	50.0±	mussed	Wings thin, crumpled
416	*ry*	51.0±	rosy	Eye color deep ruby
417	*kar*	52.0	karmoisin	Eye color like scarlet mutation *(st)* but duller, ocelli colorless

5. LINKAGE GROUPS: INVERTEBRATES

Part I. FRUIT FLY

	Gene Symbol	Locus	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)
	Chromosome III [1]			
418	*c3G*	55.0±	crossover suppressor in 3 of Gowen	Eliminates crossing over
419	*red*	55.5±	red	Red malpighian tubules
420	*jvl*	56.7	javelin-like	Bristles cylindrical, crooked
421	*cv-c*	57.9	crossveinless-c	Posterior crossvein absent or reduced
422	*Sb*	58.2	Stubble	Bristles short, thick; homozygous lethal
423	*ss*	58.5	spineless	Bristles very small
424	*bx*	58.8	bithorax (pseudo)	Balancers winglike; metathorax resembles mesothoras
425	*Rf*	59.0±	Roof	Wings drooping at sides
426	*cal*	59.5±	coal	Black body color, similar to e^4
427	*fl*	59.9	fluted	Wings creased, darkish
428	*sr*	62.0	stripe	Dark dorsal stripe
429	*M(3)f*	62.4	Minute (3) f	Minute type
430	*gl*	63.1	glass	Eye color dilute, facets fused
431	*gl-l*	64.0±	glass-like	Eyes orange, rough, and small
432	*k*	64.0±	kidney	Eyes kidney-shaped
433	*M(3)S35*	64.0±	Minute (3) Schultz' 35	Extreme minute
434	*sed*	64.5±	sepiaoid	Eye color chocolate
435	*cv-d*	65.0±	crossveinless-d	Posterior crossvein absent or reduced
436	*Cur*	66.0±	Curl	Curly wings; homozygous lethal
437	*Dl*	66.2	Delta	Veins thick at margin; homozygous lethal
438	*H*	69.5	Hairless	Some bristles and hair missing; homozygous lethal
439	*e*	70.7	ebony	Body color black
440	*det*	72.5	detached	Crossveins broken, wings folded under
441	*cd*	75.7	cardinal	Eye color dull scarlet, ocelli white
442	*wo*	76.2	white ocelli	Ocelli colorless
443	*obt*	77.5±	obtuse	Wings short, blunt
444	*bar-3*	79.1	bar-3	Phenotype like *B/B*
445	*M(3)124*	79.7	Minute (3) 124	Strong minute; allele of *M(3)w*
446	*M(3)B*	79.7	Minute (3) Burkart	Moderate minute; allele of *M(3)w*
447	*M(3)B²*	79.7	Minute (3) Bridges	Strong minute; allele of *M(3)w*
448	*M(3)w*	79.7	Minute (3) w	Strong minute
449	*l(3)a*	79.7	lethal (3) first found	Lethal; allele of *M(3)w*
450	*M(3)Fla*	80.0±	Minute (3) Florida	Strong minute; allele of *M(3)w*
451	*M(3)36e*	84.5	Minute (3) 36e	Medium minute
452	*M(3)be*	87.0±	Minute (3) beta	Medium minute
453	*mah*	88.0±	mahogany	Eye color brownish, darkening
454	*Pr*	90.0	Prickly	Bristles vestigial; homozygous semilethal
455	*M(3)j*	90.2	Minute (3) j	Extreme minute
456	*l(3)PR*	90.2	lethal with In(3R)P	Lethal; allele of *M(3)j*
457	*tx*	91.0±	taxi	Wings divergent
458	*ro*	91.1	rough	Eyes rough, small
459	*l(3)XaR*	91.8	lethal (3) XaR	Balancer of *T(2,3) Xa*
460	*cmp*	93.0±	crumpled	Wings smaller, crumpled
461	*Bd*	93.8	Beaded	Wing margins excised; homozygous lethal
462	*Pw*	94.1	Pointed-wing	Wings pointed at tip; homozygous lethal
463	*bf*	95.0±	brief	Body small, bristles minute-like; male sterile
464	*rsd*	95.4	raised	Wings rise straight up
465	*su^B-pr*	95.5	suppressor of purple	Suppresses purple *(pr)*
466	*ra*	97.3	rase	Bristles, hairs smaller, fewer
467	*Dp*	99.3±	Duplication	Similar to ultra bar
468	*ld*	100.0±	loboid	Eyes lobe-like
469	*ca*	100.7	claret	Eye color clear ruby
470	*M(3)l*	101.0	Minute (3) 1	Medium minute
471	*bv*	104.3	brevis	Bristles short, stubby
472	*M(3)g*	106.2	Minute (3) g	Slight minute, requires *E-M(3)g*
	Chromosome IV [40]			
473	*ci*	0	cubitus-interruptus	Vein L4 interrupted
474	*M-4*	0-0.2±	Minute-4	Medium minute; deficiency for *ci*, *ar*, *gvl*, and *Scn*
475	*ar*	0-0.2	abdomen rotatum	Abdomen twisted clockwise
476	*gvl*	0.2	grooveless	Scutellar groove diminished

Part II. PARASITIC WASP

Habrobracon juglandis has 10 pair of chromosomes; linkage groups have been found for 8 pair. **Linkage** (column B): slant line (/) indicates complete linkage.

	Gene Symbol	Linkage	Recombination Percentage	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)	(E)
	Linkage Group I				
1	*Sk*	*Sk--r*	12	Speckled	Bright red flecks of pigment in white eye
2	*r*	*r--gl*	13	reduced	Small wings; reduced, irregular venation
3	*gl*	*gl--x*	30	glass	Small eyes, lacking facet outlines
4	*X*	*X--fu*	10	Sex	9 alleles known (each consisting of many factors determining sex differences) that produce similar phenotypes in males and in females
5	*fu*	*fu--sb*	22	fused	Antennal segments fused; tarsal segments lacking or fused

continued

5. LINKAGE GROUPS: INVERTEBRATES

Part II. PARASITIC WASP

	Gene Symbol	Linkage	Recombination Percentage	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)	(E)
					Linkage Group I
6	*sb*	*sb--bl*	42	stubby	Males with antennae 7-9 segments long; females with antennae 5-7 segments long
7	*bl*	*bl--le*	30	black	Body color black
8	*le*	*le--c*	12	lemon	Body color pale lemon yellow
9	*c*	*c--l*	14	canteloupe	Eyes light pink, darken to deep red
10	*l*	*l--n*	3	long	Antennal segments elongated; leg segments longer and thinner than in wild type
11	*n*	*n--ho*	7	narrow	Narrow wings; cuts off irregular slices of costal and inner wing margins
12	*ho*	*ho--vl*	8	honey	Body lacks black pigment entirely
13	*vl*	*vl--ro*	15	veinless	Wing veins missing, except along costal margin
14	*ro*	*ro--bu*	12	rough	4th radius vein absent, adjacent veins roughened
15	*bu*	*bu--cr*	37	bulged	Eyes abnormally bulged transversely
16	*cr*	*cr--sl/co*	41	crescent	Eyes small; ocelli crescent-shaped, pigment reduced
17	*sl*	*sl/co--ct*	33	semilong	Antennal and leg segments lengthened
18	*co*			coalescent	Antennal segments coalescent
19	*ct*	*ct--rd*	32	cut	Outer wing margin indented or straightened, giving cut appearance
20	*rd*	*rd--gy*	37	red	Eye color varies from light red to dark red, almost black with temperature increase
21	*gy*	*gy--ac/el*	7	gynoid	Short antennae in male, resembling those in female; abdominal sclerites resemble those in female
22	*ac*	*ac/el--gy*	7	aciform	Terminal half of antennae very slender, needlelike
23	*el*			eyeless	Head malformed; eye rudiments present
					Linkage Group II
24	*k*	*k--dw*	28	kidney	Eyes kidney-shaped
25	*dw*	*dw--m*	5	dwindling	Irregularity and fusion of antennal segments
26	*m*	*m--o*	11	miniature	Reduced body size; semilethal: many die as pupae
27	*o*	*o--m*	11	orange	Eyes orange, varying to pink and red
					Linkage Group III
28	*bk*	*bk--wh/pl*	25	broken	Outer margin of primary wing broken and wings fragile
29	*wh*	*wh/pl--st*	9	white	White eye; ocelli colorless
30	*pl*			pellucid	Compound eyes semitransparent
31	*st*	*st--wh/pl*	9	stumpy	Extreme reduction of tarsal segments
					Linkage Group IV
32	*sv*	*sv--td*	23	shot-veins	Wing veins broken and distorted
33	*td*	*td--ma*	27	truncated	Wings extremely reduced, irregular in shape
34	*ma*	*ma--td*	27	maroon	Light ocelli; compound eyes deep reddish brown
					Linkage Group V
35	*wa*	*wa--br*	22	wavy	Wings shortened, costal margin wavy
36	*br*	*br--wa*	22	broad	Thorax abnormally broadened
					Linkage Group VI
37	*ta*	*ta--un*^{2}	40	tapering	Antennae deficient, with much fusion and irregularity of segments distally
38	*un*^{2}	*un*^{2}*--ta*	40	undulating-2	Surface of wings in undulating waves
					Linkage Group VII
39	*pk*	*pk/ew*^{3}		pink	Compound eyes pink
40	*ew*^{3}			extended wings	Wings extended in active wasps
					Linkage Group VIII
41	*wt*	*wt--bf*	17	wet	Wing microchaetae very long and irregular, giving wet appearance
42	*bf*	*bf--wt*	17	black feet	Tarsi abnormally black

Part III. SILKWORM

Bombyx mori has 28 pair of chromosomes; linkage groups have been found for 15 pair. **Gene Symbol** (column A): *l* = lethal.

	Gene Symbol	Locus	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)
				Linkage Group I (Z Chromosome)
1	*os*	0	sex-linked	Low translucency of larva
2	*Ge*	14.0	Giant egg	Length and width 1.26 and 1.11, respectively, times the normal egg
3	*e*	36.4	elongate	First and second abdominal segments of larva unusually elongated
4	*Vg*	38.7	Vestigial	Wings poorly developed
5	*od*	49.6	translucent	Skin of larva shows high translucency
				Linkage Group II
6	*P*	0	Plain	Full grown larva white; $+p$, p^B, p^M, p^S, p^{Sa}, multiple or pseudoalleles of *p*
7	*S*	6.1	New striped	Dark stripe on larva; heterozygote almost as dark as homozygote
8	*Gr*	6.9	Gray egg	Milky white shell, dark serosa pigment
9	*Y*	25.6	Yellow blood	Deep yellow hemolymph in larva
10	*oa*	26.7	mottled translucent	Mottled translucency on larval skin
11	*Rc*	31.8	Rusty	Yellowish-brown cocoon, lighter inner layer
				Linkage Group III
12	*Ze*	0	Zebra	Black band on anterior end of each segment; pair of black spots on ventral side of each larval segment
13	*ap*	0	apodal	All thoracic legs rudimentary
14	*lem*	22.8	lemon	Greenish-yellow coloring over skin visible from 2nd instar
				Linkage Group IV
15	*L*	0	Multilunar	Pairs of large brownish or yellowish round spots on thoracic and abdominal segments
16	*sk*	25.8	stick	Larva body slender and hard
17	*Spc*	33.1	Speckle	Many dark spots on larval skin; female sterile
				Linkage Group V
18	*pe*	0	pink-eyed	White egg; pigment absent from serosa
19	*ok*	4.7	kinshiryu	High translucency of larva
20	*re*	31.7	red egg	Reddish-brown serosa
21	*oc*	40.8	chinese	High translucency of larva
				Linkage Group VI
22	*E*	0	Plain supernumerary legs	Supernumerary legs in 1st and 2nd abdominal segments of larva; E^{Ca}, E^D, E^H, E^{Kp}, E^N, multiple or pseudoalleles of *E*
23	*Nc*	1.4	No crescent supernumerary legs	Crescents absent; supernumerary leg in the 2nd abdominal segment
24	$+M$	3.0	Tetra molting	Standard type, larva pupates after 4th molt; M^3, M^5, multiple or pseudoalleles of $+M$
25	*b2*	8.0	brown egg-2	Grayish-brown pigment in serosa
26	*F*	13.6	Flesh	Cocoon color reddish-yellow or salmon color
27	*l-k*	17.7	lethal-k	Embryo killed few days before hatching

5. LINKAGE GROUPS: INVERTEBRATES

Part III. SILKWORM

	Gene Symbol	Locus	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)
				Linkage Group VII
28	*q*	0	quail	Larval body tinted reddish-purple and covered with shredlike lines
29	*Gb*	0.7	Green b	Greenish cocoon color
30	*obt*	21.0	b_8-mottled	Moderate translucency of larva; not lethal
				Linkage Group VIII
31	*ae*	0	amylase negative	Amylase in digestive fluid weak
32	*be*	1.1	amylase negative	Amylase in body fluid (hemolymph) weak
				Linkage Group IX
33	*I*	0	Yellow inhibitor	Suppression of yellow blood and yellow cocoon
34	*I-a*	5.9	Dominant chocolate	Similar to chocolate mutation *(ch)*; head black
35	*bd*	6.7	dilute black	Whole larval body dilute black
36	*og*	7.4	giallo ascoli	High translucency; female almost sterile
				Linkage Group X
37	$w_1(w\text{-}1)$	0	white egg 1	No pigment in serosa; white eyes in moth
38	*fl*	0+	wingless	Fore and hind wings absent in pupa and moth
39	$w_2(w\text{-}2)$	3.4	white egg 2	Egg gradually changes from white to light reddish color; white eyes in moth
40	$w_3(w\text{-}3)$	6.9	white egg 3	Light purplish-brown egg; black eyes in moth
				Linkage Group XI
41	*K*	0	Knobbed	Dermal protuberances appear on dorsal sides of several segments of larva, pupa and moth
42	*Bu*	5.5	Burnt	Larva skin from 2nd to 5th segments shows burnlike scar
43	*bp*	17.1	black pupa	Black pupae (2 strains)
44	*mp*	24.0	micropterous	Small wings
				Linkage Group XII
45	*Ng*	0	No glue	Eggs easily separated from papers because of poor development of mucous glands in female
46	*C*	14.0	Golden egg	Cocoon golden yellow outside, nearly white inside
47	*rd*	52.1	clumpy	Irregular egg shape and highly variable
				Linkage Group XIII
48	*ch*	0	chocolate	Newly hatched larva reddish-brown
49	*cf*	11.3	crayfish	Fore and hind wings swollen and protrude laterally from body in pupa
				Linkage Group XIV
50	*Di*	0	Dirty	Irregular black lines and dots cover dorsal surface of larva
51	*U*	2.7	Ursa	Dark brown pigments cover dorsal and lateral sides of larva
52	*odk*	10.7	mottled	Low translucency
				Linkage Group XV
53	*Se*	0	White side egg	Egg surface irregular and with many furrows
54	*Gc*	7.8	Green c	Green cocoon

6. LINKAGE GROUPS: PLANTS

Part I. NEUROSPORA CRASSA

Genes for *Neurospora crassa* are listed in order of locus on the chromosome; they proceed from left arm to right arm, with the CENTROMERE the dividing marker. A line under the symbol indicates that the exact position has not been determined. Bracket (}) signifies no recombination between loci. Capital letters in Columns A and B do not indicate dominant genes. A stable diploid, necessary for testing dominance, has not been achieved with *Neurospora* to date.

	Gene Symbol (A)	Mutation (B)	Phenotypic Expression (C)	Reference (D)
			Linkage Group I[1]	
1	*fr*	Frost	Delicate branching and nonconidial aerial growth	31
2	*nit-2*	Nitrate-2	Does not reduce nitrate	33
3	*leu-3*	Leucine-3	Requires leucine	3,31
4	*leu-4*	Leucine-4	Requires leucine	13
5	*un(b39)*	Unknown (b39)	Grows at 25°C, not at 34°C; distal to *A/a*; not tested for allelism with *un(55701)*	21
6	*un(55701)*	Unknown (55701)	Unknown requirement; strain *55701t* grows at 25°C, but not on minimal medium at 35°C	3,16,18
7	*A/a*	Sex	Mating type	3,31
8	*dot*	Dot	Restricted colonial growth (data scanty)	33
9	*pat*	Patch	Circadian rhythm of dense and sparse mycelial growth; location proximal to *A/a*	39
10	*phen*	Phenylalanine	Requires phenylalanine or leucine, or other aromatic amino acids; location uncertain with respect to *ad-5*	2
11	*ad-5*	Adenine-5	Requires adenine	3,31,33
12	*amyc*	Amycelial	Growth budding; forms dot-like colonies; location proximal to *ad-5*	18,31
13	*arg-1*	Arginine-1	Requires arginine; does not utilize ornithine or citrulline	31
14	*arg-3*	Arginine-3	Requires arginine or citrulline; does not utilize ornithine	3,31
15	*ti*	Tiny	Very restricted colonial growth	30,31
16	*suc*	Succinic	Requires succinic acid or metabolically related compounds; closely linked to centromere	3
17	*cyt-1*	Cytochrome-1	Slow growth; altered cytochrome system; shows 5% recombination with *suc*	25
18	*sn*	Snowflake	Conidiating colonial; location between *arg-3* and *hist-2*	23
	CENTROMERE			
19	*hist-2*	Histidine-2	Requires histidine	44
20	*rg*	Ragged	Poor conidiation; colonial growth	31
21	*lys-4*	Lysine-4	Requires lysine	3,31,44
22	*hist-3*	Histidine-3	Requires histidine	3,44
23	*ad-3*	Adenine-3	Requires adenine; accumulates purple pigment on limiting adenine	3,5,6,31,36
24	*cut*	Cut	Tube culture appears as if mycelia were cut off part way up slant; location between *hist-2* and *arg-6*	21
25	*nic-2*	Nicotinic-2	Requires nicotinamide; accumulates red-brown pigment in the medium	3,31
26	*cr*	Crisp	Early uniform conidiation	3,31
27	*m-1*	Modifier of *vis(3717)*	Location proximal to *vis(3717)*	17
28	*vis(3717)*	Visible (3717)	Semi-colonial growth (located on right arm)	3,17
29	*m-2*	Modifier of *vis(3717)*	Location distal to *vis(3717)*	17
30	*st*	Sticky	Can only be scored by direct comparison with wild type; location between *hist-2* and *thi-1*	31
31	*un(44409)*	Unknown (44409)	Unknown requirement; strain *44409t* grows at 25°C on complete medium, but not at 34°C	3,31
32	*slo*	Slow	Slow growth; location proximal to *thi-1*	31
33	*thi-1*	Thiamine-1	Requires thiamine	3,31
34	*mac*	Methionine-adenine-cysteine	Requires methionine; grows best on all 3 substances or complete medium; location between *thi-1* and *al-2*	31
35	*me-6*[2]	Methionine-6	Requires methionine	3,27,31
36	*csh*	Cushion	Restricted colonial growth; location between *thi-1* and *nit-1*	36
37	*nit-1*[3]	Nitrate-1	Does not reduce nitrate	3,31,40
38	*un(STL6)*	Unknown (STL6)	Suboptimal response to methionine; best scored at 35°C; fluffy morphology with late conidiation	31
39	*arg-6*	Arginine-6	Requires ornithine, citrulline, or arginine	3,31

/1/ Other markers known to be in Linkage Group I but presumably lost: *pa*--pale--conidia clumped and pale in color; *nd*--natural death--growth ceases progressively when fungus is homocaryotic; *dir*--dirty--conidia misshapen and few, yellow exudate; *gap*--gap--conidia produced in upper part of culture tube. [3] /2/ Called *me(35809)* in reference 3. /3/ Called *n-nit* in references 3 and 40.

6. LINKAGE GROUPS: PLANTS

Part I. NEUROSPORA CRASSA

	Gene Symbol	Mutation	Phenotypic Expression	Reference
	(A)	(B)	(C)	(D)
			Linkage Group I	
40	*T*	Tyrosinase thermostability	T^S and T^L govern tyrosinase thermostability; location between *hist-2* and *al-2*	15
41	*su-1-me*	Suppressor-1-methionine	Suppresses *me-2* and *me-7*; shows 1% recombination with *al-2*	3
42	*al-2*	Albino-2	Albino	3,31
43	*aur*	Aurescent	White at first; later forms pigmented terminal conidia	3,31
44	*hs*	Homoserine	Requires homoserine	3,31
45	*can*[4]	Canavanine	Resistance to canavanine	3,31-33
46	*lys-3*	Lysine-3	Requires lysine	3,31,35
47	*nic-1*[5]	Nicotinic-1	Requires nicotinamide	35
48	*os*	Osmotic	Inhibited by high osmotic pressure; can be scored by appearance; conidia rare	31
49	*so*	Soft	Dense pigmented growth in lower part of slant	31
			Linkage Group II	
50	*cfl*	Cauliflower	Dense conidiation in bunches at top of slant	33
51	*thr-2*	Threonine-2	Requires threonine; leaky	8,27,33
52	*thr-3*	Threonine-3	Requires threonine; extremely close to *thr-2*; leaky	33
53	*bal*	Balloon	Restricted growth; hemispherical colony	14,31
	CENTROMERE			
54	*da*	Dapple	Flecks of conidia on agar surface; location uncertain with respect to *bal* and centromere	33
55	*arg-5*	Arginine-5	Requires ornithine, citrulline, or arginine	3,31
56	*arom-3*	Aromatic-3	Requires phenylalanine, tyrosine, tryptophan, and *p*-aminobenzoic acid; does not use shikimic acid	14
57	*cpt*	Carpet	Flat growth on agar slants; location uncertain with respect to *arom-3*	33
58	*pe*	Peach	Peach-colored conidia (*see* line 64)	3
59	*su-pe*	Suppressor of microconidial	Suppresses microconidial action of pe^m in *col-1*, pe^m genotype; location 14-22 map units from *pe*	12
60	*arom-1*	Aromatic-1	Requires phenylalanine, tyrosine, tryptophan, and *p*-aminobenzoic acid; grows on shikimic acid	3
61	*arom-4*	Aromatic-4	Requires phenylalanine, tyrosine, tryptophan, and *p*-aminobenzoic acid; does not use shikimic acid	14
62	*ac-1*	Acetate-1	Requires acetate plus ethanol	3
63	*tu*	Tuft	Conidia in large clusters at top of culture; location between *pe* and *fl*	3
64	*fl*	Fluffy	No macroconidia; few or no microconidia; *pe fl* genotype forms abundant microconidia	3
65	*tryp-3*[6]	Tryptophan-3	Requires tryptophan; does not use indole	3
66	*het-2*	Heterocaryon formation	Determines heterocaryon compatibility; alleles *d*, *D*	11
			Linkage Group III	
	CENTROMERE			
67	*thi-4*	Thiamine-4	Requires thiamine; location uncertain with respect to *sc*	3
68	*thi-lo*	Modifier of *thi-1*	In presence of *thi-lo*, *thi-1* requires intact thiamine; may be allelic with *thi-4*	7
69	*sc*	Scumbo	Flat, irregular, concentric growth	3
70	*mel-3*	Melon-3	Forms hemispherical colony; location uncertain with respect to centromere and markers *thi-4* to *leu-1*	26
71	*ser-1*	Serine-1	Requires serine; can use glycine; very leaky	3
72	*prol-1*	Proline-1	Requires proline; will not use ornithine, citrulline, or arginine	3
73	*com*	Compact	Small colonies	31,34
74	*me-8*	Methionine-8	Requires methionine	28
75	*ad-4*	Adenine-4	Requires adenine; will not use hypoxanthine	3,34
76	*leu-1*	Leucine-1	Requires leucine	3,31
77	*su-mel-3*	Suppressor-melon-3	A loose colonial results from interaction of *mel-3* and *su-mel-3*; location distal to *leu-1*	26
78	*hist-7*	Histidine-7	Requires histidine; located between *ad-4* and *tryp-1*	44
79	*ad-2*	Adenine-2	Requires adenine or hypoxanthine	3,33,34

/4/ Called *r-can* in reference 3. /5/ Also called *Q*. /6/ Also called *td*.

6. LINKAGE GROUPS: PLANTS

Part I. NEUROSPORA CRASSA

	Gene Symbol	Mutation	Phenotypic Expression	Reference
	(A)	(B)	(C)	(D)
			Linkage Group III	
80	*tryp-1*	Tryptophan-1	Requires indole or tryptophan; accumulates yellow pigment	3
81	*thi-2*	Thiamine-2	Requires intact thiamine	3,34
82	*ro-2*	Ropy-2	Cable-like aggregations of hyphae; location between *tryp-1* and *vel*	31,34
83	*vel*	Velvet	Soft, conidiating colonial	31,34
84	*tyr-1*	Tyrosine-1	Requires tyrosine; very leaky	3,34
			Linkage Group IV	
	CENTROMFRE			
85	*pyr-1*	Pyrimidine-1	Requires pyrimidine; uridine and cytidine 10-60 times as active as uracil	3,22,24
86	*pdx-1*	Pyridoxine-1	Requires pyridoxine	3,22,24
87	*pdx-2*	Pyridoxine-2	Requires pyridoxine	3
88	*rib-2*	Riboflavin-2	Requires riboflavin; location between *pdx-1* and *pyr-3*	3,22
89	*arg-2*	Arginine-2	Requires arginine; also uses citrulline	3,24
90	*col-4*[7]	Colonial-4	Colonial, macroconidial	3,22,24
91	*me-1*	Methionine-1	Requires methionine; location between *pdx-1* and *pyr-3*	3,28
92	*pyr-3*	Pyrimidine-3	Requires pyrimidine (*see* line 85)	3,24
93	*pt*	Phenylalanine-tyrosine	Requires phenylalanine plus tyrosine; location uncertain with respect to *pyr-3;* accumulates brown pigment in medium on aging; fluoresces under ultraviolet light	22
94	*tryp-4*	Tryptophan-4	Requires indole or tryptophan; location between *pdx-1* and *pan-1*	3,22
95	*leu(37501)*	Leucine (37501)	Requires leucine; location between *pdx-1* and *pan-1*	22
96	*ad-6*	Adenine-6	Requires adenine; location between *pdx-1* and *pan-1*	3,22
97	*me-2*	Methionine-2	Requires methionine; location between *tryp-4* and *pan-1*	3,22,28
98	*fld*	Fluffyoid	Aconidial; location proximal to *pan-1*	33
99	*thi-5*	Thiamine-5	Requires thiamine; shows 1% recombination with *pan-1*	33
100	*pan-1*	Pantothenic-1	Requires pantothenic acid	3,22
101	*ro-1*	Ropy-1	Cable-like aggregations of hyphae	22,31
102	*nit-3*[8]	Nitrate-3	Does not reduce nitrate; shows 13% recombination with *pan-1*	16,33
103	*chol-1*	Choline-1	Requires choline; location between *ad-6* and *me-5*	3,22
104	*col-1*	Colonial-1	Colonial growth; distal to *chol-1*	3
105	*cot*	Colonial-temperature sensitive	Colonial growth at 34°C; may be allelic with *col-1*	22,24
106	*ol*	Oleic acid	Requires higher fatty acid: lauric or larger, or Tween 80	33
107	*le-1*	Ascospore lethal	Colonial growth; location distal to *cot*	26
108	*hist-4*	Histidine-4	Requires histidine	22
109	*me-5*	Methionine-5	Requires methionine	3,22,24,34
110	*pyr-2*	Pyrimidine-2	Requires pyrimidine (*see* line 85)	3,22
111	*dn*	Dingy	Gray lumps, presumably microconidia, on agar slants	24
112	*mat*	Mat	Colonial; grows better on sucrose than on glycerol; location distal to *pyr-2*	22,31
			Linkage Group V	
	CENTROMERE			
113	*lys-1*	Lysine-1	Requires lysine; location uncertain with respect to centromere	3
114	*sh*	Shallow	Spreading morphological; hyphae on surface of agar slant; location uncertain with respect to *lys-1*	33
115	*iv-1*	Isoleucine-valine-1	Requires isoleucine and valine	3
116	*val*	Valine	Requires valine	43
117	*iv-2*	Isoleucine-valine-2	Requires isoleucine and valine; location uncertain with respect to *iv-1* and *val*	3
118	*lys-2*	Lysine-2	Requires lysine; location between *lys-1* and *hist-1*	42,43
119	*sp*	Spray	Aerial mycelium fans outwards	31,43
120	*arg-4*	Arginine-4	Requires arginine; also uses ornithine or citrulline; may be allelic with *arg-7;* location between *sp* and *inos*	3,33,37
121	*arg-7*	Arginine-7	Requires arginine; also uses ornithine or citrulline; may be allelic with *arg-4*	3,33,37
122	*am*	Amination-deficient	Requires α-amino nitrogen; leaky	9,31

/7/ Called *co* in reference 24. /8/ Called *nitr* in reference 16.

6. LINKAGE GROUPS: PLANTS

Part I. NEUROSPORA CRASSA

	Gene Symbol (A)	Mutation (B)	Phenotypic Expression (C)	Reference (D)
			Linkage Group V	
123	*i*	Enhancer of *am*	Inhibits growth of *am* on medium containing inorganic nitrogen plus glutamic acid; shows 8% recombination with *am*	10
124	*wa*	Washed	Thin, spreading surface growth and conidiation; location between *lys-2* and *inos*	33
125	*hist-1*	Histidine-1	Requires histidine	3,43
126	*inos*	Inositol	Requires inositol	3,43
127	*arg-8*	Arginine-8	Requires arginine; data scanty	33
128	*pab-1*	para-Aminobenzoic acid-1	Requires *p*-aminobenzoic acid	3,43
129	*me-3*	Methionine-3	Requires methionine	3,43
130	*bis*	Biscuit	Conidiating colonial	31,43
131	*ser-2*	Serine-2	Requires serine; very leaky	33
132	*ad-7*	Adenine-7	Requires adenine	42,43
133	*pab-2*	para-Aminobenzoic acid-2	Requires *p*-aminobenzoic acid	43
134	*asp*	Asparagine	Requires asparagine	3,43
135	*pl*	Plug	Dense hyphae filling tube	31,43
			Linkage Group VI[a]	
136	*ad-8*	Adenine-8	Requires adenine; far out on left arm	19
137	*cyt-2*	Cytochrome-2	Slow growth; altered cytochrome system	38
138	*asco*	Ascospores colorless	Low germination; requires lysine; *lys-5(DS6-85)* is an allele of *asco*	38,41
139	*un(66204)*	Unknown (66204)	Strain *66204t* does not grow on minimal medium at 35°C	3,38
140	*cys-2*	Cysteine-2	Requires cysteine or methionine (alleles designated *cys-c*, *cys-t* in reference 39)	38,39
141	*cys-1*	Cysteine-1	Requires cysteine or methionine	3,38
142	*ylo*	Yellow	Yellow conidia	3,38
143	*ad-1*	Adenine-1	Requires adenine	3,4,38
	CENTROMERE			
144	*pan-2*	Pantothenic-2	Requires pantothenic acid	4
145	*rib-1*	Riboflavin-1	Requires riboflavin at 35°C; location uncertain with respect to *pan-2* and *del*	3,38
146	*del*	Delicate	Growth less than that of wild type	20,31
147	*tryp-2*	Tryptophan-2	Requires anthranilic acid, indole, or tryptophan; leaky	3,38
			Linkage Group VII	
148	*nic-3*	Nicotinic-3	Requires nicotinamide	31,33
	CENTROMERE			
149	*sfo*	Sulfonamide	Requires sulfonamide; location uncertain with respect to centromere	3
150	*thi-3*	Thiamine-3	Requires thiamine; leaky; best scored on agar slants after several days	3,31
151	*bn*	Button	Colonial; nonconidiating	31
152	*me-9*	Methionine-9	Requires methionine; leaky	29
153	*me-7*	Methionine-7	Requires methionine; proximal to *arg-11*	33
154	*col-2*	Colonial-2	Colonial; nonconidiating	1,3,33
155	*col-3*	Colonial-3	Colonial; nonconidiating	1,3,33
156	*thr-1*	Threonine-1	Requires threonine; proximal to *arg-11*	33
157	*wc*	White collar	No carotenoids except at low temperature; proximal to *arg-11*	33
158	*for*	Formate	Requires formate or adenine plus methionine; proximal to *arg-11*	33
159	*arg-11*	Arginine-11	Requires arginine, adenine, and uridine	31
160	*arg-10*	Arginine-10	Requires arginine; does not use ornithine or citrulline	31
161	*nt*	Nicotinic-tryptophan	Requires nicotinamide or tryptophan	3,31
162	*sk*	Skin	Flat growth; nonconidiating	31

/a/ Also known to be in Linkage Group VI but presumably lost: *phen(38602)*--phenylalanine (38602)--requires phenylalanine. [2,16]

Part II. CHLAMYDOMONAS REINHARDI

Genes for *Chlamydomonas reinhardi* are listed in order of locus on the chromosome; they proceed from left arm to right arm, with the CENTROMERE the dividing marker. In those linkage groups with genes mapped in only one arm of the chromosome, the CENTROMERE is listed first. A line under the gene symbol indicates that the exact position has not been determined. Bracket (}) signifies no recombination between loci. Lower case letters in column A do not necessarily indicate recessive genes.

	Gene Symbol (A)	Mutation (B)	Phenotypic Expression (C)	Reference (D)
			Linkage Group I	
1	*ac-209*	Acetate-209	Requires acetate	5
	CENTROMERE			
2	*ac-76*	Acetate-76	Requires acetate	5
3	*arg-1*	Arginine-1	Requires arginine, citrulline, or ornithine	1-4
4	*ac-14*	Acetate-14	Requires acetate	3
5	*arg-2*	Arginine-2	Requires arginine; does not utilize citrulline or ornithine	2-4
6	*pab-2*	*p*-Aminobenzoic-2	Requires *p*-aminobenzoic acid	2-4
7	<u>*ac-115*</u>	Acetate-115	Requires acetate; does not fix CO_2; shows 0.5% recombination with *pab-2*	7
8	*pf-4*	Paralyzed-4	Cells with paralyzed flagella	5
9	*thi-3*	Thiamine-3	Requires thiamine or thiazole	2-4

Part II. CHLAMYDOMONAS REINHARDI

	Gene Symbol	Mutation	Phenotypic Expression	Reference
	(A)	(B)	(C)	(D)
			Linkage Group II	
10	*thi-9*	Thiamine-9	Requires thiamine	5
	CENTROMERE			
11	*ac-12*	Acetate-12	Requires acetate	3
12	*pf-12*	Paralyzed-12	Cells with paralyzed flagella	3
13	*pf-18*	Paralyzed-18	Cells with paralyzed flagella	3
14	*nic-2*	Nicotinic-2	Requires nicotinamide	3,4
			Linkage Group III	
15	*pf-15*	Paralyzed-15	Cells with paralyzed flagella	3
16	*ac-28*	Acetate-28	Requires acetate; shows 0.6% recombination with *pf-15*	3
17	*pf-5*	Paralyzed-5	Cells with paralyzed flagella; shows 0.5% recombination with *pab-1*	5
18	*pab-1*	*p*-Aminobenzoic-1	Requires *p*-aminobenzoic acid	3,4
19	*ac-26*	Acetate-26	Requires acetate	5
	CENTROMERE			
20	*ac-17*	Acetate-17	Requires acetate; closely linked to centromere	3
21	*ac-141*	Acetate-141	Requires acetate; does not fix CO_2	7
22	*thi-2*	Thiamine-2	Requires thiamine or thiazole plus pyrimidine	3,4
			Linkage Group IV	
23	*nic-11*	Nicotinic-11	Requires nicotinamide	3
	CENTROMERE			
24	*thi-4*	Thiamine-4	Requires thiamine or thiazole	3,4
25	*pf-20*	Paralyzed-20	Cells with paralyzed flagella	3
26	*ac-55*	Acetate-55	Requires acetate; colonies yellow	5
			Linkage Group V	
27	*ac-31*	Acetate-31	Colonies yellow	3
28	*thi-8*	Thiamine-8	Requires thiamine or pyrimidine	3
29	*ac-18*	Acetate-18	Requires acetate	5
	CENTROMERE			
30	*pf-1*	Paralyzed-1	Cells with paralyzed flagella	3
			Linkage Group VI	
31	*mt*	Mating type	Mating type plus or minus	3
32	*nic-7*	Nicotinic-7	Requires nicotinamide	3,4
33	*thi-10*	Thiamine-10	Requires thiamine	5
34	*ac-29*	Acetate-29	Colonies yellow	5
	CENTROMERE			
35	*pf-14*	Paralyzed-14	Cells with paralyzed flagella	3
			Linkage Group VII	
36	*ac-6*	Acetate-6	Requires acetate	5
	CENTROMERE			
37	*pf-17*	Paralyzed-17	Cells with paralyzed flagella	3
38	*ac-1*	Acetate-1	Requires acetate; colonies almost white	3,4
39	*ac-22*	Acetate-22	Requires acetate; grows slowly; colonies pale green	5
40	*ac-5*	Acetate-5	Requires acetate; grows slowly; colonies pale yellow	5
			Linkage Group VIII	
41	*pf-3*	Paralyzed-3	Cells with paralyzed flagella	5
42	*thi-1*	Thiamine-1	Requires intact thiamine	3,4
	CENTROMERE			
43	*ac-157*	Acetate-157	Requires acetate	3,4
			Linkage Group IX	
44	*ac-51*	Acetate-51	Requires acetate	3
45	*pf-16*	Paralyzed-16	Cells with paralyzed flagella	3
46	*sr-1a*	Streptomycin-1a	Resistance to streptomycin; allelic with *sr-7* [1]	5,8
	CENTROMERE			
47	*ac-15*	Acetate-15	Requires acetate	3
48	*pf-13*	Paralyzed-13	Cells with paralyzed flagella	3

Part III. CORN

The genes in each linkage group for *Zea mays* are carried by the corresponding chromosome, e.g., linkage group I, chromosome 1; linkage group II, chromosome 2, etc. Capital letters (columns A and C) indicate dominant genes.

	Gene Symbol	Locus	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)
				Linkage Group I
1	*sr*	0	striate	Leaves striated
2	ga_6	15	gametophyte factor	Gametophyte viability
3	zb_4	21	zebra striping	Leaves with alternating transverse bands of green and whitish sectors
4	ms_{17}	25	male sterile	Male sterile
5	ts_2	27	tassel seed	Terminal inflorescence with pistillate flowers
6	*P*	28	Pericarp	Pericarp color
7	*zl*	30	zygotic lethal	Lethal zygote
8	*as*	53	asynaptic	Chromosomes unpaired at meiosis
9	*hm*	66	*Helminthosporium* susceptibility (recessive)	Susceptible to *Helminthosporium* infection
10	*br*	80	brachytic	Stalk has short internodes
11	*Vg*	84	Vestigial glumes	Glumes underdeveloped
12	f_1	85	fine striped	Fine striped, green and white leaves
13	an_1	107	anther ear	Stamens develop in pistillate inflorescence
14	*Kn*	128	Knotted leaves	Wartlike growths on leaves and stalk
15	gs_1	134	green striped	Leaves with light green stripes between vascular bundles
16	Ts_6	157	Tassel seed	Terminal inflorescence with pistillate flowers
17	bm_2	161	brown midrib	Brown pigment in leaf midrib
				Linkage Group II
18	ws_3	0	white sheath	Leaf sheaths and stalk deficient in chlorophyll
19	*al*	4	albescent	Seedlings become whitish
20	lg_1	11	liguleless	Absence of ligule on leaves

Part III. CORN

	Gene Symbol	Locus	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)
				Linkage Group II
21	gl_2	30	glossy seedling	Seedlings smooth and shining
22	B	49	Anthocyanin booster	Increases anthocyanin pigments
23	sk	56	silkless	Ears without silks
24	fl_1	68	floury endosperm	Endosperm powdery
25	ts_1	74	tassel seed	Terminal inflorescence with pistillate flowers
26	v_4	83	virescent	Young seedlings deficient in chlorophyll
27	Ch	138	Chocolate	Chocolate pericarp
				Linkage Group III
28	cr_1	0	crinkly leaves	Leaves crinkled
29	d_1	18	dwarf	Abnormally undersized
30	rt	32	rootless	Lacking roots
31	lg_3	36	Liguleless	Absence of ligule on leaves
32	Rg	40	Ragged leaves	Leaves appear split and torn due to development of necrotic areas
33	ts_4	47	tassel seed	Terminal inflorescence with pistillate flowers
34	ba_1	64	barren stalk	No ear produced
35	na_1	75	nana (dwarf)	Abnormally undersized
36	a_1	103	anthocyanin	Anthocyanin pigments present
37	sh_2	103.0+	shrunken endosperm	Endosperm shrunken
38	et	115	etched endosperm	Endosperm etched
39	ga_7	121	gametophyte factor	Gametophyte viability
				Linkage Group IV
40	de_1	0	defective endosperm	Endosperm defective
41	Ga_1	35	Gametophyte factor	Gametophyte viability
42	Ts_5	56	Tassel seed	Terminal inflorescence with pistillate flowers
43	sp_1	66	small pollen	Pollen of small size
44	su_1	71	sugary endosperm	Endosperm sugary
45	de_{16}	74	defective endosperm	Endosperm defective
46	zb_6	84	zebra striping	Leaves with alternating transverse bands of green and whitish sectors
47	Tu	100	Tunicate (pod corn)	Enlarged glumes in male and female inflorescences
48	j_2	105	japonica striping	Leaves green and white striped
49	gl_3	111	glossy seedling	Seedlings smooth and shining
				Linkage Group V
50	gl_{17}	0	glossy seedling	Seedlings smooth and shining
51	a_2	1	anthocyanin	Anthocyanin pigment present
52	bm_1	7	brown midrib	Brown pigment in leaf midrib
53	bt_1	8	brittle endosperm	Endosperm brittle
54	v_3	11	virescent	Young seedlings deficient in chlorophyll
55	bv	13	brevis (dwarf) plant	Undersized
56	pr	32	red aleurone color	Aleurone red
57	ys	41	yellow stripe	Leaves green and yellow striped
58	v_2	73	virescent	Young seedlings deficient in chlorophyll
				Linkage Group VI
59	po	0	polymitotic	Spores undergo extra meiotic-like divisions; male sterile
60	Y	13	Yellow endosperm	Endosperm yellow
61	pg_{11}	33	pale green	Light green seedlings and plants
62	Pl	44	Purple plant	Plant purple
63	Bh	45	Blotched aleurone	Aleurone blotched
64	sm	54	salmon silk	Salmon-colored silk
65	py	64	pigmy	Dwarf plant
				Linkage Group VII
66	o_2	0	opaque endosperm	Endosperm opaque
67	in	4	intensifier of aleurone color	Color of aleurone intensified
68	v_5	8	virescent	Young seedlings deficient in chlorophyll
69	ra_1	22	ramosa	Branching of ear and tassel
70	gl_1	26	glossy seedling	Seedlings smooth and shining
71	Tp	36	Teopod	Plant with many tillers and narrow leaves; ears and tassels have enlarged bracts

Part IV. TOMATO

Linkage groups for *Lycopersicon esculentum* do not correspond to similarly numbered chromosomes. Some linkage groups have not been assigned to a particular chromosome, while some chromosomes have not been given a linkage group number. Capital letters (columns A and C) indicate dominant genes.

	Gene Symbol (A)	Locus (B)	Mutation (C)	Phenotypic Expression (D)
			Linkage Group I (Chromosome 2)	
1	*dv*	0	dwarf virescent	Stunted plants
2	*m*	3	mottled leaves	Leaves and cotyledons mottled
3	*d*	5	dwarf plant	Plant dwarfed; leaves dark and rugose
4	*p*	9	peach	Peach or pubescent fruit
5	*op*	13	opaca	Yellow-green patches on leaves
6	*dil*	17	dilute	Leaves light green
7	*ps*	20	positional-sterile	Positional-sterile flowers; prevents normal opening of corolla
8	*ro*	22	rosette	Rosette; very short internodes, no flowers

continued

6. LINKAGE GROUPS: PLANTS

Part IV. TOMATO

	Gene Symbol (A)	Locus (B)	Mutation (C)	Phenotypic Expression (D)
			Linkage Group I (Chromosome 2)	
9	*O*	29	Oval fruit	Spherical, oblate, and elongate fruit
10	*aw*	30	without anthocyanin	No anthocyanin; stem green, not purple
11	*suf*	33	sufflava	Uniform light-green leaves
12	ms_{10}	35	male sterile-10	Pale anthers; exserted pistils; sterile
13	*bk*	36	beaked fruit	Sharp-pointed protuberance on blossom-end of fruit
14	*Cu*	38	Curl	Veins and petiole greatly foreshortened, leaves curled
15	*Me*	39	Mouse ears	Leaves pinnately compound, segments clavate
16	*wv*	42	white virescent	Plant virescent
17	*Wo*	48	Woolly plant	Woolly leaves and stems
18	*s*	53	compound inflorescence	Inflorescence much-branched; greatly increased number of flowers
19	*ne*	60	necrotic leaves	Necrotic leaf spots; leaves slowly killed
20	*Lc*	67	Few fruit locules	Fruits with only 2 or 3 locules
			Linkage Group II (Chromosome 3)	
21	*r*	0	yellow fruit flesh	Yellow flesh color
22	*wf*	15	white flower	White or tan corolla
			Linkage Group III (Chromosome 1)	
23	*br*	0	brachytic	Brachytic plants with short internodes
24	*y*	30	colorless fruit skin	Clear colorless skin on fruit
25	Cf_1	65	*Cladosporium* resistance	Resistance to races 1 and 3 of *Cladosporium fulvum*
			Linkage Group IV (Chromosome 6)	
26	*c*	0	potato leaf	Potato leaf; reduced number of leaf segments
27	*sp*	2	self-pruning (determinate habit)	Self-pruning or determinate stems
28	*md*	25	mottled-2	Small chlorotic spots on leaves
29	*Mi*	59	Nematode resistance	Resistance to *Meloidogyne incognita*
30	*yv*	60	yellow virescent	Leaves yellowish
31	Cf_2	61	*Cladosporium* resistance	Resistance to races 1-4 of *Cladosporium*
			Linkage Group V	
32	*bi*	0	bifurcata inflorescence	Branched inflorescence
33	*f*	2	fasciated fruit	Fasciated or many-loculed fruits
34	*a*	29	anthocyanin absent	Anthocyaninless; stems and leaves green, never purple
35	*hl*	49	hairless	Hairless plants; no hairs on hypocotyl
36	*gh*	54	ghost plants	Chlorophyll-deficient plants
37	j_1	69	jointless pedicel	Jointless pedicels
38	Cf_3	86	*Cladosporium* resistance	Resistance to races 1-4 of *Cladosporium*
			Linkage Groups VI and VIII (Chromosome 8)	
39	*al*	0	anthocyanin loser	Anthocyanin loser; purple stems become green in 10-21 days
40	*gf*	23	green flesh	Persistent chlorophyll in fruit
41	*dl*	40	dialytic stamens	Dialytic; stamens are not united in a tube
42	*bu*	49	bushy	Bushy stems; short internodes, long petioles
43	*ch*	65	chartreuse petals	Small, yellow-green corolla
44	l_1	76	lutescent foliage	Premature yellowing of leaves; yellowish unripe fruits
			(Chromosome 9)	
45	*wd*	0	wilty dwarf	Wilty dwarf plants; grayish-green, droopy leaves
46	*ah*	1.5	Hoffman's anthocyaninless (recessive)	Green stems
			Linkage Group VII (Chromosome 10)	
47	*pe*	0	sticky peel	Sticky fruit epidermis
48	*lg*	8	light green foliage	Light green foliage
49	*u*	43	uniform-ripening fruit	Uniform light-green color of unripe fruits; no dark shoulders
50	*H*	61	Hairs absent	Nonhairy or smooth stems; hypocotyl and growing point hairy
51	*nd*	72	netted	Leaves chlorotic with chlorophyll concentrated around veins
52	l_2	79	lutescent-2	Leaves turn yellow
53	*t*	92	tangerine fruit color	Flesh and stamens orange color
54	*Xa*	124	Xantha seedlings	Xanthophyllic or yellow leaves
55	*ag*	139	Andrus' green stem (recessive)	Green stem but purple cotyledons

continued

6. LINKAGE GROUPS: PLANTS

Part IV. TOMATO

	Gene Symbol	Locus	Mutation	Phenotypic Expression
	(A)	(B)	(C)	(D)
	Linkage Groups X and XII (Chromosome 7)			
56	*wt*	0	wilty foliage	Wilty leaflets; leaf margins curl adaxially
57	*tf*	15	trifoliate	Terminal leaflet tripartite
58	*n*	30	nipple-tipped fruit	Nipple tips on fruit
59	*mc*	46	macrocalyx	Sepals much enlarged
	Linkage Group XI (Chromosome 4)			
60	*e*	0	entire leaves	Entire or broad leaflets, as in Vilmorin's potato leaf
61	*di*	20	divergens	Leaf and stem color gray-green
62	w_1	28	wiry foliage	Wiry, slender, straplike leaflets; dwarfed plants
	Unnumbered Linkage Group A			
63	*rv*	0	reticulate virescent	Leaves virescent, veins prominent
64	*sf*	34	solanifolium	Potato-like leaves
	Unnumbered Linkage Group B			
65	*La*	0	Lanceolate	Entire, small leaves
66	*na*	28	nana	Tiny plants with short leaves

7. GENETIC CODE

The nucleotide compositions of RNA codewords have been obtained by directing amino acids into protein in *Escherichia coli* extracts with randomly ordered polyribonucleotides synthesized with polynucleotide phosphorylase. Nucleotide sequence in codewords is not known, thus the order of bases is arbitrary. The tentative summary of RNA codewords shown in the table are considered to be ***potential*** codewords; that is, they code for amino acids in cell-free systems, but all codewords may not be applicable to cells in vivo.

	Amino Acid	RNA Codewords[1]					Amino Acid	RNA Codewords[1]			
	(A)	(B)					(A)	(B)			
1	Alanine	CCG	UCG[2]	ACG[2]		11	Leucine	UUG	UUC	UCC	UUA
2	Arginine	CGC	AGA	UGC[2]	CGA[2]	12	Lysine	AAA	AAU		
3	Asparagine	ACA	AUA	ACU[2]		13	Methionine	UGA			
4	Aspartic acid	GUA	GCA[2]	GAA[2]		14	Phenylalanine	UUU	CUU		
5	Cysteine	UUG				15	Proline	CCC	CCU	CCA	CCG[2]
6	Glutamic acid	GAA	GAU[2]	GAC[2]		16	Serine	UCU	UCC	UCG[2]	ACG
7	Glutamine	AAC	AGA	AGU[2]		17	Threonine	CAC	CAA		
8	Glycine	UGG	AGG	CGG		18	Tryptophan	GGU			
9	Histidine	ACC	ACU[2]			19	Tyrosine	AUU			
10	Isoleucine	UAU	UAA			20	Valine	UGU	UGA[2]		

/1/ Summary as of September, 1963. /2/ Probable codeword.

8. CELL TYPES: SEED PLANTS

Because only approximate boundaries can be drawn between certain cell types in seed plants, the data have been restricted to the more salient and histologically apparent characteristics of the more common cell types. Spores, gametes, and many of the specialized cells have been omitted.

	Cell Type	Specification	Description
	(A)	(B)	(C)
1	Apical meristem	Origin	Lineal descendents of cells of embryo, except in adventitious shoots and roots
2		Site	Apices of vegetative shoots, developing inflorescences, and flowers; in root, beneath inner edge of root cap
3		Morphology	Cells polyhedral; primary wall thin or irregularly thickened; primary pit fields may be present; nucleus large, ovoid; cytoplasm vacuolated; mitochondria, plastid primordia, and storage products may be present
4		Function	Point of origin of primary meristematic tissues (protoderm, ground meristem, procambium) from which primary body of shoot and root develops; in shoot apex, gives rise to tissue of leaf primordia
5	Vascular cambium	Origin	Procambium, and parenchyma in interfascicular areas, cortex, and phloem
6		Site	Lateral in stem and root, between secondary xylem and secondary phloem
7		Morphology	Two types of cambial cells: elongated fusiform initials (from which tracheary elements, sieve elements, fibers, and vertical parenchyma are derived), and ray initials (from which vascular rays originate); cytoplasm in both cell types highly vacuolated; primary walls have conspicuous pit fields
8		Function	Produces secondary phloem and secondary xylem cells; growth in diameter of woody stems and roots results from tissue formation by cambial cells
9	Phellogen (cork cambium)	Origin	In stems, first phellogen cells arise from cortex (most commonly from outermost layer), or from epidermis or phloem parenchyma cells; in roots, from pericycle
10		Site	Lateral in stem and root, between phellem and subjacent phelloderm, cortical or phloem tissue; also beneath surface exposed by abscission of organs (leaf scars) or beneath wounds
11		Morphology	Cells rectangular and radially flattened in transectional view, polygonal or nearly isodiametric in longisection; walls thin, cytoplasm vacuolated; may contain tannins and chloroplasts
12		Function	Produces phellem cells outwardly and in many cases phelloderm cells inwardly; forms complementary tissue of lenticels
13	Epidermis	Origin	Protoderm
14		Site	Surface layer of foliar and floral organs, young stems and roots
15		Morphology	Cells polygonal, elongated, or with undulated contour in surface view; variable in radial dimensions; walls thin or thick, the outer wall often thicker; primary pit fields present; walls typically cutinized (may be lignified or silicified), the outer wall covered by cuticle except in roots; plastids, anthocyanin pigments, and ergastic substances may occur
16		Function	Mechanical protection; restriction of transpiration; storage of water and metabolic products; photosynthesis; water absorption in roots; by division and dedifferentiation may contribute to origin of adventitious shoots and roots
17	Guard cell	Origin	Typically originate in pairs by division of specific "mother cells" of the protoderm; (in many plants paired guard cells are flanked or surrounded by distinctive subsidiary cells)
18		Site	Epidermis of foliage leaves and young stems; occurs in the epidermis of various types of floral organs; absent from epidermis of roots
19		Morphology	Cells usually crescentic or kidney-shaped in surface view; walls unevenly thickened, cutinized and overlaid by cuticle; often with ridgelike extensions above and below pore; conspicuous starch-forming chloroplasts present; protoplast physiologically active in mature cells but rarely divides in response to wound or other stimuli
20		Function	A pair of guard cells and the intercellular space or pore between them form a stoma. Reversible changes in turgor of guard cells result in the opening or closure of the pore, permitting diffusion of gases through the epidermis.
21	Phellem (cork)	Origin	Phellogen; in stems of some monocotyledons, tangentially dividing cortical parenchyma cells produce irregular bands of suberized cells termed "storied cork"
22		Site	Peripheral regions of stem, root, and some fruits; occurs in bud scales and petioles; often produced as a result of wounding
23		Morphology	Cells rectangular in transection and radially flattened; irregular or rectangular in longisection; wall typically suberized and devoid of pits; nonliving at maturity; may contain resin and tannins
24		Function	Mechanical protection; restriction of transpiration
25	Parenchyma	Origin	Ground meristem, procambium, vascular cambium, and phellogen
26		Site	Dominant cell type in cortex, pith, mesophyll, fleshy fruits, and endosperm of seeds; occurs in phloem and xylem as component of vertical strands and vascular rays
27		Morphology	Cells approximately tetrakaidecahedral to elongated, or stellately branched; primary walls thin or thick, often with conspicuous pit fields; thick, lignified secondary walls with pits common in secondary xylem; plastids and a large number of ergastic substances present

continued

8. CELL TYPES: SEED PLANTS

	Cell Type	Specification	Description
	(A)	(B)	(C)
28	Parenchyma	Function	Photosynthesis; food and water storage; secretion and excretion; commonly the protoplast retains marked capacity for growth, division, and differentiation, and therefore is prominently concerned in wound healing, formation of callus tissue, and the origin of adventitious shoots and roots
29	Collenchyma	Origin	Ground meristem
30		Site	Sole component of cylinders or strands of tissue in the subepidermal portions of stems, petioles, and larger veins of leaves; may occur in root cortex
31		Morphology	Cells relatively short and prismatic, or elongated with tapering ends; primary walls unevenly thickened and composed of cellulose, pectin, and a high percentage of water; primary pit fields present; chloroplasts common; collenchyma and cortical parenchyma cells frequently intergrade in form and structure
32		Function	Mechanical support for growing stems and leaves; protoplast retains capacity for growth, division, and differentiation
33	Sclereid	Origin	Protoderm, ground meristem, phellogen, vascular cambium, and procambium; frequently arises by sclerosis of a fully developed parenchyma cell
34		Site	Common in seed coats and fruits; diffusely arranged (as idioblasts or as a component of cell clusters) in cortex, functioning phloem, outer bark, pith, and mesophyll; in leaves of some dicotyledons, sclereids are restricted to vein endings (terminal sclereids)
35		Morphology	Cells may be polyhedral, columnar, fusiform, filiform, irregularly lobed or branched; in some cases they intergrade in form with fibers; secondary wall thick and lignified (sometimes with imbedded crystals); pits usually simple, often ramiform; protoplast may be retained at maturity
36		Function	Produces hard, incompressible texture of many tissues
37	Fiber	Origin	Protoderm, ground meristem, procambium, and vascular cambium
38		Site	Cortex, primary and secondary vascular tissues of stem and root; epidermis of some leaves; component of hypodermal strands or layers and of the sclerenchymatous sheaths of vascular bundles in many kinds of leaves; cells may occur as idioblasts
39		Morphology	Typical prosenchymatous cell, frequently elongated; secondary wall usually thick, often highly lignified; pits abundant or scarce, simple or with greatly reduced borders; protoplast usually absent at maturity; a living protoplast and various ergastic materials occur in septate fibers; in secondary xylem of dicotyledons, fibers and tracheids frequently intergrade in form and structure
40		Function	Mechanical support
41	Tracheid	Origin	Procambium and vascular cambium
42		Site	Primary and secondary xylem; in a modified form, the distinctive cell type in transfusion tissue of gymnosperm leaves; in leaves of some angiosperms, tracheid-like cells, termed "storage tracheids," occur as idioblasts, as cells associated with veinlets, or as components of cell groups or layers; commonly formed in masses in cultures of callus tissue
43		Morphology	Cells imperforate, and typically elongated with blunt, tapering, or inclined ends; patterns of lignified secondary wall thickenings diversified and often intergrading (annular, helical, scalariform, reticulate, pitted); devoid of protoplast at maturity
44		Function	Conduction of water and mineral solutes; mechanical support
45	Vessel member	Origin	Procambium and vascular cambium
46		Site	Primary and secondary xylem of most dicotyledons; absent from xylem of all gymnosperms except members of the Gnetales; in some monocotyledons, restricted to primary xylem of root
47		Morphology	Cell form ranges from elongate to drum-shaped, with inclined or transversely oriented end walls; a series of superposed vessel members constitutes a vessel; perforation plates usually restricted to end walls and are either simple (one perforation) or multiperforated (scalariform, reticulate, or foraminate); secondary walls lignified (with same range of patterns as in tracheids); devoid of protoplast at maturity
48		Function	Conduction of water and mineral solutes; possibly furnishes mechanical support
49	Sieve cell	Origin	Procambium and vascular cambium
50		Site	Primary and secondary phloem of gymnosperms
51		Morphology	Cells elongated, with overlapping inclined or tapering ends; sieve areas numerous, uniform, and relatively undifferentiated; a sieve area is a portion of the primary wall, traversed by strands of cytoplasm, each strand enclosed in a cylinder of callose; protoplast enucleate at maturity; usually associated with certain ray and phloem-parenchyma cells termed "albuminous cells"
52		Function	Conduction of organic solutes
53	Sieve-tube member	Origin	Procambium and vascular cambium
54		Site	Primary and secondary phloem of angiosperms

continued

8. CELL TYPES: SEED PLANTS

	Cell Type	Specification	Description
	(A)	(B)	(C)
55	Sieve-tube member	Morphology	Cells elongated, with inclined or transverse end walls; a series of superposed sieve-tube members constitutes a sieve tube; end walls with highly specialized sieve areas termed sieve plates; sieve plates are either simple (one sieve area) or compound (several sieve areas in scalariform or reticulate arrangement); lateral walls usually bear less-differentiated sieve areas; protoplast enucleate at maturity; each sieve-tube member associated with one or more nucleate cells (companion cells) which are ontogenetically developed as daughter cells of the sieve-tube member
56		Function	Conduction of organic solutes
57	Laticifer	Origin	Nonarticulated laticifers originate from single cells in the embryo and grow intrusively throughout plant; articulated laticifers arise from interconnected series of cells in which partial or complete removal of certain walls occurs
58		Site	Cortex, secondary phloem and xylem, pith, mesophyll
59		Morphology	Nonarticulated type is either an unbranched tube or a profusely ramified system of nonseptate tubes; articulated laticifers may become joined by lateral anastomoses to form a complex network; primary walls nonlignified and often thick; both types contain latex and are multinucleate
60		Function	Probably largely excretory because of storage of such apparently nonfunctional metabolic products as resins and rubber; the role of laticifers as food-conducting or food-storing structures is doubtful

9. TISSUE GROWTH CHARACTERISTICS: MAMMALS

	Tissue	Growth Feature	Growth Characteristics
	(A)	(B)	(C)
1	Adrenal	Division	Rat (adult), mitosis: zona capsula and zona fasciculata, 0.13% each; zona glomerulosa, 0.17%; zona reticularis, 0.06%; total gland, 0.12%. For young rat, percentages higher than for adult. [12, 73]
2		Mode of growth	Rat: Principally by cell division; capsule may contribute. [12]
3		Life span	Rat: In cortex, uncertain; phagocytosis occurs in zona reticularis. [12]
4		Replacement	Rat: In cortex, cell division and migration of cells from superficial to deeper layers [12, 73].
5		Regenerative capacity	Man, guinea pig: In cortex after damage, repair by cell division (limited in adult) [48]. Active regeneration follows postnatal degeneration. Man, rat: Mitosis scant in medulla; postnatal growth due to cell enlargement. [73, 85]
6	Alimentary canal	Division	Cat, stomach: Dividing cells at base of foveolae [49]. Rat: Dividing cells in crypts of duodenum and ileum; make up 3% of all cells; cycle, 1.13 hours. [64]
7		Mode of growth	Cell division and differentiation in mucous membrane. Muscle, by combination of cell division and increase in cell size. [75]
8		Life span	Rabbit, oral mucosa: 5.1(4.5-5.7)/1,000 cells; diurnal variation, 3.8(3.6-4.0) and 7.2(6.6-7.8). Mitotic duration calculated as 64 minutes. Intermitotic period calculated as 208 hours. [55] Rat, small intestine: 60-70% of superficial epithelium shed per day. Cell lives 1.57 days in duodenum, 1.35 days in ileum. [64]
9		Replacement	Cat: Cells multiply in crypts in base of foveolae, move toward lumen and differentiate [49].
10		Regenerative capacity	Cat: Brunner's glands can undergo limited regeneration [43]. Stomach: Movement at 0.2-0.4 mm/hr; epithelium, after sudden loss, restored in a few hours. [49] Dog, stomach: After removal of mucous membrane, denuded area covered by growth of undifferentiated epithelium at rate of 2 mm/wk [41].

continued

	Tissue	Growth Feature	Growth Characteristics
	(A)	(B)	(C)
11	Blood erythrocytes	Division	Confined largely to erythroblasts in bone marrow. Man, dividing cells: 1.17-1.83%. [76, 81]
12		Mode of growth	Rabbit, rat, chicken: In precursors, growth phase sharply separated from hemoglobin formation [86].
13		Life span	Man: 120 days most generally accepted [24].
14		Replacement	Man: 0.83% red cells replaced each day [24].
15		Regenerative capacity	Man: Recovery in 50 days from 600-ml blood loss [45]. Rabbit: Recovery in 3 weeks from 30% blood loss [18]. Rat: Recovery in 7 days from 30% blood loss [18].
16	Blood granulocytes	Division	Man: Confined largely to myeloblasts (2.7%) and myelocytes (0.46%) in bone marrow [81].
17		Mode of growth	Rabbit, rat, chicken: Growth stages sharply demarcated from stages of granule formation [86].
18		Life span	Man: Neutrophils estimated at 70-80 hours; eosinophils, 10-14 days. [58] Cat: Neutrophils disappear from blood at rate of 881/cu mm/hr [62].
19		Replacement	Cat: Replaced 1.5 times per day [62].
20	Blood lymphocytes	Division	In tissues of origin. Rat (3 months old), dividing cells: thymus, 0.22%; lymph nodes, 0.058%; lymph follicles in spleen, 0.058%. [5]
21		Mode of growth	Rabbit, marrow: Derived from reticulum cells and may be converted to other forms (?) [70]. Cat: 35 x 10^6 kg/hr enter circulation [2]. Dog: 25 x 10^6 kg/hr enter circulation [92].
22		Life span	Approximately 24 hours. Removed from blood by lungs (rat) [89], spleen (rabbit) [40], lymph glands (dog) [92], skin (rat) [6], intestine [51].
23		Replacement	Replacement in blood stream 2.06 times per day [2, 92, 93].
24		Regenerative capacity	Rabbit (young): Limited regeneration of lymph nodes after removal; mesenchyme cells form complete gland in 3-4 weeks. [46]
25	Blood platelets	Mode of growth	Evidence favors formation in marrow from cytoplasmic fragmentation of megakaryocytes [91].
26		Life span	Cat: 2-4 days; utilization, 2,500 cu mm blood/hr. [63]
27		Replacement	Dog: After loss, new formation begins in a few hours; normal level regained in 3-4 days. [87].
28	Brain and spinal cord	Division	Rat: Very rare but has been reported [4].
29		Mode of growth	Growth of axones, myelination of fiber tracts. May not be completed until 18th year in man. [34]
30		Life span	Coextensive with normal function [75].
31		Replacement	Confined to neuroglia [75].
32		Regenerative capacity	Cat: Preganglionic fibers in peripheral nerves regenerate in 36-61 days [56]; function restored in 44 days [47]. Very largely confined to neuroglia; some axone formation. Rabbit: Regeneration of motor axones occurs at 4 mm/da after latent period of ±7 days. [94]
33	Hair	Growth rate	Man: head, 2.7 mm/wk; arm, 1.5 mm/wk; face, 2.1-3.5 mm/wk. [38, 88]
34		Life cycle	Depends on thickness. Man: head, 3 years; eyebrow, 120 days. [23] Rat: body, 35 days [23].
35		Replacement	By multiplication and differentiation of cells at bottom of hair follicles [38, 88].
36	Heart	Mode of growth	Man (from birth to maturity): Diameter of muscle fibers increases 2.6 times (to 14 μ) [82]. Rabbit: Diameter of muscle fibers increases 2.6 times (to 19 μ) [82].
37		Life span	Coextensive with normal function [75].
38		Replacement	None [75].
39		Regenerative capacity	Negligible; hypertrophy caused by increase in size of fibers. Man: normal diameter, 14 μ; hypertrophied, 25 μ. [82] Rabbit: normal diameter, 19.2 μ; hypertrophied, 22.2 μ. [82]
40	Hypophysis	Division	Observed in normal animals. Occurs in anterior lobe after injury. Division stimulated when endocrine disturbances develop. Activity noted after administration of estrogen, testosterone, etc. [25]
41	Kidney	Division	Rare after early postnatal life, except for regeneration in rodents [75].
42		Mode of growth	Increase in size of cells and structures. Man (from birth to maturity): Diameter of glomerulus increases from 118 μ to 240 μ, diameter of proximal collecting tubules from 18-34 μ to 40-64 μ. [32, 59, 75] Rat: Early postnatal growth partially caused by peripheral, undifferentiated nephrogenic zone; number of nephrons doubles in first two weeks of life. [13, 75]
43		Life span	Very largely coextensive with normal function [75].
44		Replacement	By cell divisions in tubules [75].
45		Regenerative capacity	Rat: True regeneration observed; hypertrophy caused by enlargement of existing elements, but increased cell division demonstrated after unilateral nephrectomy. [25, 26]

continued

	Tissue	Growth Feature	Growth Characteristics
	(A)	(B)	(C)
46	Liver	Division	Rat: Dividing cells rise from low values to 3.3% on 23rd day, then return to low [19,66]. (Albino), mitosis: 0.005% [19].
47		Mode of growth	Rat: In early life, considerable contribution from cell division; later from increase in cell size. [66]
48		Life span	Rat: No figure available [66].
49		Replacement	Rat: Dividing cells persist in small numbers in adult, presumably to replace cell loss [66].
50		Regenerative capacity	Rat: Extirpation of two-thirds regenerated in 21 days, caused by cell division in parenchymal cells and, to a smaller extent, in duct cells; division also occurs in Kupffer's cells and connective tissue cells. [1]
51	Muscle, smooth	Division	Fibers retain some power of division [16].
52		Mode of growth	New formation possible from undifferentiated connective tissue cells [16].
53		Regenerative capacity	Regeneration after injury limited; fibrous scar usual. [16]
54	Muscle, striped	Division	Scant; confined to nuclei. Some amitotic division. [16]
55		Mode of growth	Enlargement and possible splitting of fibers. In newborn, some continued formation from mesenchyme cells. Hypertrophy caused by increase of sarcoplasm in preexisting cells. [16]
56		Life span	Coextensive with normal function [75].
57		Replacement	Normally none [75].
58		Regenerative capacity	Rabbit: Protoplasmic outgrowth from preexisting fibers in which nuclei may divide by amitosis. Outgrowth begins 3rd day after injury, progresses at 1-1.5 mm/da. New fibers 30% of normal diameter in 21 days; normal diameter in 4 months. No new formation from undifferentiated cells. [28, 31]
59	Nails	Mode of growth	Man, thumbnail: Daily increase of 95μ. (Fingernails grow 4 times as fast as toenails.) [30]
60	Ovary	Division	Rat: Mitosis demonstrated in germinal epithelium, and during pregnancy in granulosa and theca interna cells [11, 37].
61		Mode of growth	Rabbit: Follicles increase in size exponentially with time; completed in 11 days. [35, 36] Rat: Total number of oocytes in gland related to age; log (no.) = 4.561-0.476 log (age in days). [50, 67]
62		Life span	Fertility loss of shed ova: ferret, 30 hours; guinea pig, 26 hours; rabbit, 12 hours. [53]
63		Regenerative capacity	Mouse: No regeneration of ova; marked regenerative activity of germinal epithelium after hormonal stimulation. [65]
64	Pancreas	Mode of growth	Man: Decrease in relative amount of connective tissue after birth; adult proportions reached at 11th-16th year. [39]
65		Regenerative capacity	Man, dog, guinea pig, rabbit: Limited amount after resection or duct ligation. Mitosis in acinar cells and duct epithelium, the latter giving rise to acinar and islet cells. [25]
66	Parathyroid	Division	Mouse, dividing cells: 8 days, 0.07%; 18 days, 0.71%; 28 days, 0.01%. [44]
67		Mode of growth	Multiplication of clear or stem cells which differentiate into "dark" cells [42, 44].
68		Regenerative capacity	Man: Negligible. Hypertrophy and hyperplasia in chronic nephritis. [3]
69	Prostate gland	Division	Rat, mitosis: Numerous up to 20th day, scant at 100 days [77].
70		Mode of growth	Man: During last months of pregnancy, fetal prostate shows proliferation and alteration of tubule epithelium, squamous metaplasia, cystic dilation of tubules, hyperplasia and dilation of ejaculatory ducts. These persist for 1-4 weeks after birth, then undergo gradual regression. [7, 25] Man, rat: Growth affected by hormonal activity [7, 77, 78]. Rat: By cell proliferation up to 20 days, then by increase in cell size and diameter of acini; from 11 to 55 days, height of cell increases from 18 μ to 34 μ, and diameter of acini from 43 μ to 170 μ. [77]
71		Regenerative capacity	Man: Regeneration very rare after surgical removal [25].
72	Salivary gland	Division	Rat, mitosis per 1,000 acinar cells: parotid, 1.02±0.23; sublingual, 0.70±0.23; submandibular, 0.64±0.17. Mitosis per 1,000 tubular cells: submandibular, 0.44±0.12. [27]
73		Life span	Rat, acinar cells: parotid, 41 days; sublingual, 60 days; submandibular, 65 days. Tubular cells: submandibular, 95 days. [27]
74		Replacement	Rat: By division of acinar or tubular cells [27, 72].
75		Regenerative capacity	Rat: Slight regeneration by proliferation of acinar cells and of intercalated ducts [27, 72].

continued

9. TISSUE GROWTH CHARACTERISTICS: MAMMALS

	Tissue	Growth Feature	Growth Characteristics
	(A)	(B)	(C)
76	Skin	Division	Mouse (newborn): 2-4% nucleated cells in mitosis [20, 33]. (8-16 weeks old): Mitotic cycle, 30.2±12 minutes [60]. (Adult): 2-8 dividing cells/cm length of 7-μ ear section [20, 33]. Mouse, rat: Occurs in varying proportions in stratum spinosum. Number of divisions varies with time of day, carbohydrate metabolism, hormonal stimulation, etc. [54] Rat (250 grams): Mitosis in the planta averages 5.24% for 24 hours at 27°C [84].
77		Mode of growth	Division of cells in deeper layers, followed by differentiation [75].
78		Life span	Rabbit, rat: Variable; dependent on rate of shedding of keratinized cells. [55, 84] Rat, plantar epidermis cells: 19.1 days, of which 16.9 days are spent in basal layer and 2.2 days in stratum granulosum [84]. Mitotic index for corneal epithelium, 0.4% [22].
79		Replacement	Mouse: Adjustment between cell loss and cell formation [21].
80		Regenerative capacity	Man: High capacity for regeneration and repair [29]; re-epithelization of wounds by proliferation and migration of adjacent cells [15, 28, 71]; regeneration possible from hair follicles [15]. Man, rat: Growth of granulation tissue checked by epithelium overgrowth [14, 15].
81	Submaxillary gland	Regenerative capacity	Rat: Regeneration by division of acinar cells in 1st week, followed by proliferation of ducts with acini formed from terminal portions [25].
82	Testis	Division	Rat (albino): Cycle of spermatogonal division, 48 minutes; spermatogenic wave lasts 4 days; spermatogenic cycle takes 16 days. [80]
83		Life span	Sperm survival time: man, 48-72 hours; horse, 12 hours; mouse, 13.5 hours; rabbit, 96 hours; bat, possibly through winter. [8, 9, 52, 83]
84		Regenerative capacity	Possible after slight injury. Rabbit: One day in abdominal cavity causes loss of spermatogenic elements; restoration in 2 weeks. [10]
85	Thymus	Division	Mitosis: rabbit (adult), 0.52%; rat (3 month old), 0.22%. [5]
86		Mode of growth	Develops from pharyngeal epithelium [42]. Man: Increases from birth to puberty, decreases in later life. Weight at birth, 12-15 g; at puberty, 30-40 g; at 60 years, 10-15 g. [16]
87	Thyroid	Division	Guinea pig: 100-125 dividing cells recorded in whole gland [17].
88		Mode of growth	Develops from pharyngeal epithelium [42]. Dog: Proliferation of interfollicular cells [95]. Rabbit: New follicles by budding [90].
89		Regenerative capacity	Man, dog, guinea pig: After partial removal, hypertrophy of remainder preventable by iodine administration [68, 69, 79].
90	Uterus	Mode of growth	Man, menstruation: In proliferative stage, mitosis in endometrium rises to 0.56%, and nuclei of muscle fibers increase in size; regression in secretory phase. [74] Epithelial cells spread from gland tubules over connective tissue of endometrium, covering denuded surface by 7th day [25]. Pregnancy: Enlargement of preexisting epithelial cells, glands, and muscle fibers; cell division of epithelial and muscle elements; new muscle fibers may form from undifferentiated cells. [16, 61]
91		Regenerative capacity	Mouse: Experimental incision healed in 48 hours without scar [57].

10. CELL DIVISION FREQUENCY: MICROORGANISMS

For information on additional species, consult reference 1, Part I.

Part I. PROTOZOA

	Class	Species	Culture Medium	Temp. °C	Cell Divisions per Day	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
1	Ciliata	*Didinium nasutum*	Hopkins' medium + *Paramecium*	21	3.6	2
2		*Paramecium aurelia*	Lettuce + bacteria	20±	0.72	6
3			Lettuce + bacteria	28	2.02	6
4		*Stentor coeruleus*	Peters' medium + ciliates	19	0.6-0.9	4
5			Modified Peters' medium + ciliates	18-20	0.7-2.1	4
6			Hetherington's medium +*Blepharisma*	22	0.65	3
7	Mastigophora	*Chilomonas paramecium*	Sodium acetate + mineral salts	24	3.5	5
8		*Euglena gracilis*	Wheat infusion	25	3.5	7

Part II. VIRUSES AND BACTERIA

Culture Medium (column B): MS = mineral salts; AM = allantoic membrane.

	Species	Culture Medium	Temp. °C	Generation Time min	Reference
	(A)	(B)	(C)	(D)	(E)
	Vira[1]				
1	Influenza A (PR-8)	AM, chick embryo	37	330-510	10
2	Influenza A (5 strains)	AM, chick embryo	37	300-360	14
3	Influenza B (3 strains)	AM, chick embryo	37	480-600	14
4	Swine influenza	AM, chick embryo	37	360	14
	Bacteriophyta[2]				
5	*Aerobacter aerogenes*	Broth or milk	37	18	16
6		Glucose + peptone	37	17.2-17.4	16
7		Peptone	37	22-30	16
8		Synthetic	37	29-44	9
9	*Azotobacter chroococcum*	Glucose broth	.....	27-39	16
10		MS + sugar	25-30	240-348	16
11		Sugar + urea	28	74	4
12	*Bacillus subtilis*	Glucose broth	.....	26-32	16
13	*Clostridium botulinum*	Glucose broth	37	35	23
14	*Corynebacterium diphtheriae*	Serum + glucose broth	37	34	16
15	*Diplococcus pneumoniae I*	Broth	37	24.5	2
16		Serum	37	29	1
17		Serum + broth	37	20.5	6
18	*D. pneumoniae II*	Broth	37	33	6
19		Glucose broth	37	30	15
20		Serum + broth	37	23	2

/1/ Generation time: the time required for infected cells to release new virus. /2/ Generation time: the average interval between cell divisions.

11. ORGANIC COMPOUNDS AFFECTING CELL DIVISION

	Substance	Organism	Tissue	Effect	Reference
	(A)	(B)	(C)	(D)	(E)
			Interphase		
1	Acridines	*Gallus domesticus*	Chicken fibroblast	Initiation of prophase inhibited	37
2	Auxin	Spermatophyta	Flowering-plant cambium	Shortened	58
3	Azaguanine	*Mus* sp.	Mouse tumor	Initiation of prophase inhibited	66
4	Cortisone	*Allium cepa*	Onion root	Differentiated cell nuclei induced to divide	19
5	Dyes	*Rana* sp.	Frog sperm	Initiation of prophase inhibited	5
6	Folic acid antagonists	*Mus* sp.	Mouse intestine	Pycnosis from preprophase damage	23,24
7	Glucose	*Mus* sp.	Mouse epidermis	Shortened	8
8	Hydroquinone	*Mus* sp.	Mouse intestine	Pycnosis from preprophase damage	23,24
9	Hypoxanthine	*Gallus domesticus*	Chicken osteoblast	Shortened	31
10	Indoleacetic acid	*Allium cepa*	Onion root	Differentiated cell nuclei induced to divide	19
11		*Nicotiana tabacum*	Tobacco pith	Chromosome doubling within nucleus	43
12	Naphthaleneacetic acid	*Phaseolus* sp.	Bean internodes	Differentiated cell nuclei induced to divide	19
13	Neotetrazolium	*Allium cepa*	Onion root	Pycnosis from preprophase damage	56
14	Nitrogen mustard	*Rattus* sp.	Rat corneal epithelium	Initiation of prophase inhibited	26
15	Phenylacetic acid	*Allium cepa*	Onion root	Initiation of prophase inhibited	15
16	Trypaflavine	*Allium cepa*	Onion root	Destruction of interphase nucleus	52
17	Urethan	*Mus* sp.	Mouse intestine	Pycnosis from preprophase damage	23,24
			Prophase		
18	Acridines	*Allium cepa*	Onion root	Reversion to interphase	16
19	Aureomycin	*Allium cepa*	Onion root	Membrane dissolution delayed	64
20	Dichlorophenoxyacetic acid	*Allium cepa*	Onion root	Blocked	17
21	Glutathione	*Amoeba proteus*	Whole organism	Accelerated	10
22	Nitrophenols	*Arbacia punctulata*	Sea-urchin egg	Blocked	11
23	Protoanemonin	*Zea mays*	Corn root	Blocked	25
24	Purines	*Arbacia punctulata*	Sea-urchin egg	Reversion to interphase	14
25	Tropolones	*Tradescantia* sp.	Spiderwort stamen hair	Precocious chromosome split	63
26	Trypan blue	*Oryctolagus cuniculus*	Rabbit fibroblast	Spindle formation slowed	61
27	Urethan	*Oryctolagus cuniculus*	Rabbit fibroblast	Accelerated	7
			Metaphase		
28	Alcohol	*Allium cepa*	Onion root	Nucleolus neoformation	59
29	Colchicine	*Allium cepa*	Onion root	Monopolar mitotic figure induced	27
30	DDT	*Allium cepa*	Onion root	Nucleolus neoformation	59
31	Diethylbromacetyl carbamide	*Allium cepa*	Onion root	Multipolar spindle induced	49
32	Diphenyl	*Triticum* sp.	Wheat root	Spindle rotation	28
33	Endothal	*Pisum sativum*	Pea root	Chromosome noncongregation	65
34	Ethylmercuric phosphate	*Zea mays*	Corn seedling	Multipolar spindle induced	55
35	Indoleacetic acid	*Triticum* sp.	Wheat root	Spindle rotation	9
36	Methyl naphthohydroquinone diacetate	*Allium cepa*	Onion root	Multipolar spindle induced	46
37	Methyl naphthoquinone	*Allium cepa*	Onion root	Abnormal chromosome orientation	46
38	Narcotics	*Allium cepa*	Onion root	Monopolar mitotic figure induced	49
39	Phenylurethan	*Arbacia punctulata*	Sea-urchin egg	Monopolar mitotic figure induced	50
40	Streptomycin	*Allium cepa*	Onion root	Reversion to interphase	64
41	Testosterone, estrone	*Oryctolagus cuniculus*	Rabbit fibroblast	Abnormal chromosome orientation	60
42	Thallium acetate	*Allium cepa*	Onion root	Chromosome noncongregation	2
			Anaphase		
43	Caffeine	*Allium cepa*	Onion root	Incomplete chromosome separation	42
44	Ryanodine	*Echinarachnius parma*	Sand-dollar egg	Incomplete chromosome separation	13
45	Trypaflavine	*Oryctolagus cuniculus*	Rabbit fibroblast	Incomplete chromosome separation	6

II. REPRODUCTION

12. PROPAGATION: MAMMALS

For additional information, consult references 2 and 6. **Type of Estrus** (column E): P = polyestrous; M = monoestrous. Values in parentheses are ranges, estimate "c" or "d" unless otherwise indicated (cf. Introduction).

	Species	Common Name	Age at Puberty	Breeding Season	Estrus Type	Estrus Cycle da	Gestation Period da	Young per Litter	Reference
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)	(I)
1	*Homo sapiens*	Man	♀13.5 (11-16)[b] yr	All year	P	28.4 (24-33)[b]	278[1] (253-303)[b]	1[2]	3,17,37, 47,50,51, 64,81
2	*Balaenoptera physalus*	Finback whale	3 yr	Nov-Mar[3], June-Aug[4]	...	....	360	1	56,67,84
3	*Bos taurus*	Cattle	6-10 mo	All year	P	(14-23)	284(210-335)	Usually 1	49,54,66
4	*Camelus bactrianus*	Bactrian camel	....	All year	P	(10-20)	(389-410)	1	8,12,65
5	*Canis familiaris*	Dog	6-8 mo	Spring-autumn	M	9	63(53-71)	7(1-22)	31,54,58
6	*Capra hircus*	Goat	8 mo	Sept-winter	P	21	151(135-160)	(1-5)	4,5
7	*Cavia porcellus*	Guinea pig	55-70 da	All year	P	(16-19)	68(58-75)	3(1-8)	11,46,83
8	*Dasypus novemcinctus*	Nine-banded armadillo	1 yr	June-Aug	...	....	(210-240)	4	75
9	*Didelphis marsupialis virginiana*	Virginia opossum	♂ 8 mo, ♀6 mo	Jan-Oct	P	28	(12.5-13.0)	9(5-13)	41-43
10	*Elephas maximus*	Asiatic elephant	8-16 yr	....	P	....	624(510-730)	Usually 1	18,27,28, 63,71
11	*Equus caballus*	Horse	1 yr	All year[5]	P	(10-37)	336(264-420)	Usually 1	54
12	*Erinaceus europaeus*	European hedgehog	2nd yr	Mar-Sept	M	....	(35-49)	5(3-7)	22,45
13	*Felis catus*	Cat	6-15 mo	Feb-July	P[6]	(15-28)	63(52-69)	4	9,33,35, 53,73
14	*Macaca mulatta*	Rhesus monkey	♂3-4 yr, ♀ 1.5-2.5 yr	All year	P	28	168(144-194)	1	1,21,44, 77-80
15	*Mesocricetus auratus*	Golden hamster	5-8 wk	All year	P	4	16(15-18)	(1-12)	15,23,70
16	*Mus musculus*	House mouse	35 da	All year	P	4	(19-31)	6(1-12)	25,62
17	*Mustela vison*	Mink	1 yr	Mar-Apr	P[6]	(8-9)	53(39-76)	(4-10)	13,29,76
18	*Myotis lucifugus*	Little brown bat	♂, 2nd summer; ♀, end 1st summer	Autumn, spring	M[7]	....	(50-60)	1	34,36,38, 59
19	*Ondatra zibethica*	Muskrat	1 yr	Apr-Oct	P	(3-5)	30(19-42)	7(1-11)	57,72
20	*Ornithorhynchus anatinus*	Platypus	1-2 yr	July-Oct	M	60	12 (incubation)	Usually 2	19,30
21	*Oryctolagus cuniculus*	European rabbit	5.5-8.5 mo	All year	P[6]	....	31(30-35)	8(1-13)	7,39,61
22	*Ovis aries*	Sheep	7-8 mo	Sept-late winter[8]	P	(14-20)	151(144-152)	(1-4)	54,66
23	*Phoca vitulina*	Harbor seal	5-6 yr	June-Aug[9], Sept[10]	M	....	270	1	26,40
24	*Phocaena phocaena*	Harbor porpoise	14 mo	July-Aug	...	....	(300-330)	1	48,60,68
25	*Procyon lotor*	Raccoon	♂ 2 yr, ♀ 1 yr	Jan-June	P	....	63(60-73)	4(1-6)	10,74
26	*Rattus norvegicus*	Norway rat	40-60 da	All year	P	(4-5)	21	(6-9)	6
27	*Sciurus carolinensis*	Gray squirrel	1-2 yr	Dec-Aug	...	....	44	4(1-6)	24,32,52
28	*Sorex araneus*	European shrew	2nd yr	Mar-Sept	P	....	(13-19)	7	14
29	*Sus scrofa*	Swine	7(5-8) mo	All year	P	(18-24)	114(101-130)	9(6-15)	49,54,55, 66,69
30	*Tamias striatus*	Eastern chipmunk	2.5-3.0 mo	Mar-July	P	....	31	(3-6)	20,33

/1/ From first day of last menses; 268(250-285)[c] days after rise in basal body temperature [82]. /2/ Multiple pregnancies (mainly twins) = 1.0-1.5% of total births [16]. /3/ Northern hemisphere. /4/ Southern hemisphere. /5/ Mainly spring-autumn. /6/ Induced ovulation. /7/ Ovulation in spring. /8/ Coarse-wooled breeds only; fine-wooled breeds, all year. [6] /9/ Atlantic. /10/ Pacific.

14. PROPAGATION: REPTILES

For information on additional species, consult reference 1. The manner of fertilization for all reptiles is internal (by copulation). **Gestation Time** (column E) = period from copulation to parturition (ovoviviparous reptiles); **Incubation Time** = period from laying to hatching of eggs (oviparous reptiles). **Manner of Birth** (column F): Ovo = ovoviviparous; O = oviparous. Values in parentheses are ranges, estimate "c" or "d" (cf. Introduction).

15. PROPAGATION: AMPHIBIANS

For information on additional species, consult reference 1. The rate of growth and development of amphibians is influenced by temperature, moisture, and light to a much greater degree than is the rate of growth and development of homoiotherms. Manner of development is oviparous. **Fertilization** (column D): Ext = external; Int = internal. **Parental Care** (column G): 0 = none; ♀ = female guards or transports eggs; ♂ = male guards or transports eggs.

16. PROPAGATION: FISHES

For additional information, consult references 2,13,21,25,31-33,38. Spawning activities vary with species, locale, and water temperature. The number of eggs produced varies (from a few to millions) with the species. The number of eggs may also differ greatly within a single species, depending chiefly on the size of the female. **Water** (column D): F = fresh; S = salt; B = brackish; L = lacustrine; V = fluviatile; (a) = anadromous. **Fertilization** (column E): Ext = external; Int = internal. **Egg Type** (column F): D = demersal; PB = pelagic or buoyant eggs. **Development or Birth** (column G): O = oviparous; Ovo = ovoviviparous; V = viviparous. **Parental Care** (column I): 0 = none; ♂ = male guards nest or eggs; C = eggs covered by gravel or sand.

17. PROPAGATION: AQUATIC INVERTEBRATES

For information on additional species, consult reference 2. Breeding habits of invertebrates may vary with changes in location, temperature, light, and, for marine forms, with changes in salinity. **Type of Sexuality** (column F): D = dioecious (unisexual); M = monoecious (bisexual or hermaphroditic). **Dimorphism** (column G): + = sexual dimorphism; - = no sexual dimorphism. Values in parentheses are ranges, estimate "c" (cf. Introduction).

	Class and Species (Common Name)	Distribution[1]	Sexual Maturity: Age at Onset	Sexual Maturity: Size[2] mm	Breeding Season	Sexuality: Type	Sexuality: Dimorphism	Eggs or Young per Brood	Reference
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)	(I)

20. BREEDING SYSTEMS: ANGIOSPERMS

For information on additional species, consult reference 1. Species are those of economic importance. The systems listed indicate the usual breeding classification for a species; where variability exists within a species, only the predominant system (enclosed in parentheses) is given. **System** (column C): SC-S = self-compatible (predominantly self-fertilized), with no inbreeding degeneration; SC-M = self-compatible, monoecious (staminate and pistillate flowers borne on same plant), but rarely self-fertilized under conditions of open pollination; SC-O = self-compatible, intermediate (between SC-S and SC-M), with perhaps a predominance of outcrossing; SI = self-incompatible (sterile to own pollen); D = dioecious (staminate and pistillate flowers borne on separate plants). All data are from reference 2, unless otherwise indicated.

	Species	Common Name	System
	(A)	(B)	(C)
	Monocotyledoneae		
1	*Allium cepa*	Garden onion	(SC-O)[1]
2	*Asparagus officinalis*[2]	Garden asparagus	D
3	*Avena sativa*	Common oat	SC-S
4	*Hordeum vulgare*	Barley	SC-S
5	*Iris* spp.	Iris	SC-O
6	*Lilium regale*	Regal lily	(SC-O)
7	*Oryza sativa*	Rice	SC-S
8	*Phleum pratense*	Timothy	SI
9	*Phoenix dactylifera*[2]	Date palm	D
10	*Triticum* spp.	Wheat	SC-S
11	*Yucca* spp.	Yucca	SI
12	*Zea mays*	Corn	SC-M
	Dicotyledoneae		
13	*Acer* spp.	Maple	SC-O
14	*Alnus* spp.	Alder	SC-M
15	*Beta vulgaris*	Beet	SI
16	*Betula* spp.	Birch	SC-M
17	*Capsicum frutescens*	Bush red pepper	SC-O
18	*Carya* spp.	Hickory	SC-M
19	*Catalpa speciosa*	Northern catalpa	SC-O
20	*Cinchona* spp.	Cinchona	SI
21	*Citrus* spp.	Citrus	(SC-O)[1]
22	Cucurbitaceae species	Cultivated species of gourds	SC-M
23	*Daucus carota*	Carrot	SC-O
24	*Digitalis purpurea*	Common foxglove	SC-O
25	*Fagopyrum esculentum*	Buckwheat	SI[3]
26	*Fagus* spp.	Beech	SC-M
27	*Fragaria virginiana*[2]	Virginia strawberry	D[4]
28	*Fraxinus* spp.	Ash	SC-O
29	*Glycine soja*	Soybean	(SC-S)
30	*Gossypium* spp.	Cotton	SC-S
31	*Helianthus annuus*	Common sunflower	SI
32	*Ilex* spp.[2]	Holly	D
33	*Ipomoea batatas*	Sweet potato	SI
34	*Juglans* spp.	Walnut	SC-M
35	*Lactuca sativa*	Lettuce	SC-S
36	*Lycopersicon esculentum*	Tomato	SC-O
37	*Malus pumila*	Common apple	SI
38	*Medicago sativa*	Alfalfa	SI
39	*Nicotiana tabacum*	Common tobacco	SC-O
40	*Pastinaca sativa*	Parsnip	SC-O
41	*Persea americana*	American avocado	SC-O
42	*Phaseolus vulgaris*	Kidney bean	SC-S
43	*Pisum sativum*	Garden pea	SC-S
44	*Populus* spp.[2]	Poplar	D
45	*Prunus domestica*	Garden plum	(SI)
46	*P. persica*	Peach	SC-O
47	*Pyrus communis*	Pear	SI
48	*Quercus* spp.	Oak	SC-M
49	*Raphanus sativus*	Garden radish	SI
50	*Ribes* spp.	Currant	SC-O
51	*Rosa* spp.	Roses, most species	SC-O
52	*Salix* spp.[2]	Willow	D
53	*Solanum tuberosum*	Potato	SC-O
54	*Trifolium hybridum*	Alsike clover	SI
55	*Ulmus* spp.	Elm	SC-M
56	*Vicia faba*	Broad bean	SC-O
57	*Vitis vinifera*	European grape	SC-O

/1/ Some are apomictic (reproduction without fertilization). /2/ Information from reference 3. /3/ Heterostyled, i.e., stigma and stamens inserted at different levels. /4/ Cultivated forms are selected intersexes.

21. PROPAGATION METHODS: CULTIVATED PLANTS

For information on additional species, consult reference 3. The methods listed for a genus are those most widely used in cultivation, but not all species of the genus can be propagated by each method. Horticultural varieties are not propagated by seed, as the new plants from seed may vary considerably from the parent plant. When propagation by seed is employed, the seed of species having no apparent rest period may be sown in the spring, while the seed of species having a definite rest period should be artificially stratified or sown in the autumn. **Preferred Time** (column C): spr = spring; sum = summer; aut = autumn; win = winter.

	Species (Common Name)	Method	Preferred Time	Reference
	(A)	(B)	(C)	(D)
	Gymnospermae			
1	*Abies* spp. (fir)	Seed	Aut or spr	19,20,48

22. SEED GERMINATION: HERBACEOUS PLANTS

For information on additional species, consult reference 1.

	Species	Common Name	Substrate	Germination Temp.[1] °C	Germination Time[2] da	Special Requirements
	(A)	(B)	(C)	(D)	(E)	(F)
	Monocotyledoneae					
1	*Allium cepa*	Garden onion	Between blotters or toweling	20	6-10	None
2	*Asparagus officinalis*	Garden asparagus	Between blotters; between folded paper toweling; soil or sand	20-30	7-21	None
3	*Avena sativa*	Common oat	Between folded paper toweling; soil or sand	15	5-10	Prechill at 5° or 10°C for 5 days
4	*Hordeum vulgare*	Barley	Between folded paper toweling; soil or sand	15	4-7	Prechill at 5° or 10°C for 5 days
5	*Oryza sativa*	Rice	Between blotters; between folded paper toweling; soil or sand	20-30	5-14	None
6	*Phleum pratense*	Timothy	Closed petri dish with cotton, blotter, or filter paper; top of blotters	20-30	5-10	Light; prechill at 5° or 10°C for 5 days
7	*Poa pratensis*	Kentucky bluegrass	Closed petri dish with cotton, blotter, or filter paper	10-30	10-28	Light; 0.1% KNO_3 solution; prechill dormant seeds at 10°C for 5 days
8	*Triticum* spp.	Wheat	Between folded paper toweling; soil or sand	15	4-7	Prechill at 5° or 10° C for 5 days
9	*Zea mays*	Corn	Rolled towel; soil or sand	25	4-7	None
	Dicotyledoneae					
10	*Antirrhinum* spp.	Snapdragon	Closed petri dish with cotton, blotter, or filter paper	20-30	5-12	Light; fresh and hybrid seed may require prechilling at 3° or 5°C for 10-20 days
11	*Beta vulgaris*	Beet	Between blotters; soil or sand	20-30	3-14	Soak in water for 2 hours; rinse, blot surface dry
12	*Capsicum* spp.	Pepper	Top of blotters	20-30	6-14	Light; 0.2% KNO_3 solution
13	*Chrysanthemum maximum*	Pyrenees chrysanthemum	Top of blotters	20-30	8	Light
14	*Cucumis sativus*	Cucumber	Between folded paper toweling; soil or sand; between blotters	20-30	3-7	None
15	*Cucurbita* spp.	Gourd	Between folded paper toweling; soil or sand	20-30	4-7	Keep substrate drier than for other seeds
16	*Daucus carota*	Carrot	Between blotters	20-30	6-21	None
17	*Fagopyrum esculentum*	Buckwheat	Between blotters; between folded paper toweling	20-30	3-6	None

/1/ Ranges indicate that a daily fluctuating temperature is preferred for germination: 16 hours at the lower temperature and 8 hours at the higher temperature. /2/ Maximum germination is usually obtained during the given time limit; for hard-coated seeds an additional 5 days is recommended.

22. SEED GERMINATION: HERBACEOUS PLANTS

	Species	Common Name	Substrate	Germination Temp.[1] °C	Germination Time[2] da	Special Requirements
	(A)	(B)	(C)	(D)	(E)	(F)
			Dicotyledoneae			
18	*Glycine soja*	Soybean	Rolled towel; soil or sand	20-30	5-8	None
19	*Gossypium* spp.	Cotton	Rolled towel; soil or sand	20-30	4-12	None
20	*Helianthus annuus*	Common sunflower	Between folded paper toweling; between blotters	20-30	3-7	None
21	*Lactuca sativa*	Lettuce	Closed petri dish with cotton, blotter or filter paper	20	7	Light; prechill at 10°C for 3 days, or test at 15°C
22	*Lycopersicon esculentum*	Tomato	Between blotters or toweling; closed petri dish with cotton, blotter, or filter paper	20-30	5-14	Dormant seed: light; 0.2% KNO_3 solution
23	*Medicago sativa*	Alfalfa	Between blotters; soil or sand	20	4-7	None
24	*Nicotiana tabacum*	Tobacco	Closed petri dish with cotton, blotter, or filter paper; top of blotters	20-30	7-14	Light
25	*Pastinaca sativa*	Parsnip	Between blotters	20-30	6-28	None
26	*Phaseolus vulgaris*	Kidney bean	Rolled towel; soil or sand	20-30	5-8	None
27	*Pisum sativum*	Garden pea	Rolled towel; soil or sand	20	5-8	None
28	*Raphanus sativus*	Garden radish	Between blotters	20	4-6	None
29	*Rheum rhaponticum*	Garden rhubarb	Top of blotters; top of soil	20-30	7-21	Light
30	*Solanum melongena*	Eggplant	Closed petri dish with cotton, blotter or filter paper; top of blotters	20-30	7-14	Dormant seed: light; 0.2% KNO_3 solution
31	*Trifolium hybridum*	Alsike clover	Between blotters; soil or sand	20	3-7	Dormant seed: 15°C
32	*Vicia faba*	Broad bean	Soil or sand; creped cellulose paper wadding	20	4-14	Prechill at 10°C for 3 days

/1/ Ranges indicate that a daily fluctuating temperature is preferred for germination: 16 hours at the lower temperature and 8 hours at the higher temperature. /2/ Maximum germination is usually obtained during the given time limit; for hard-coated seeds an additional 5 days is recommended.

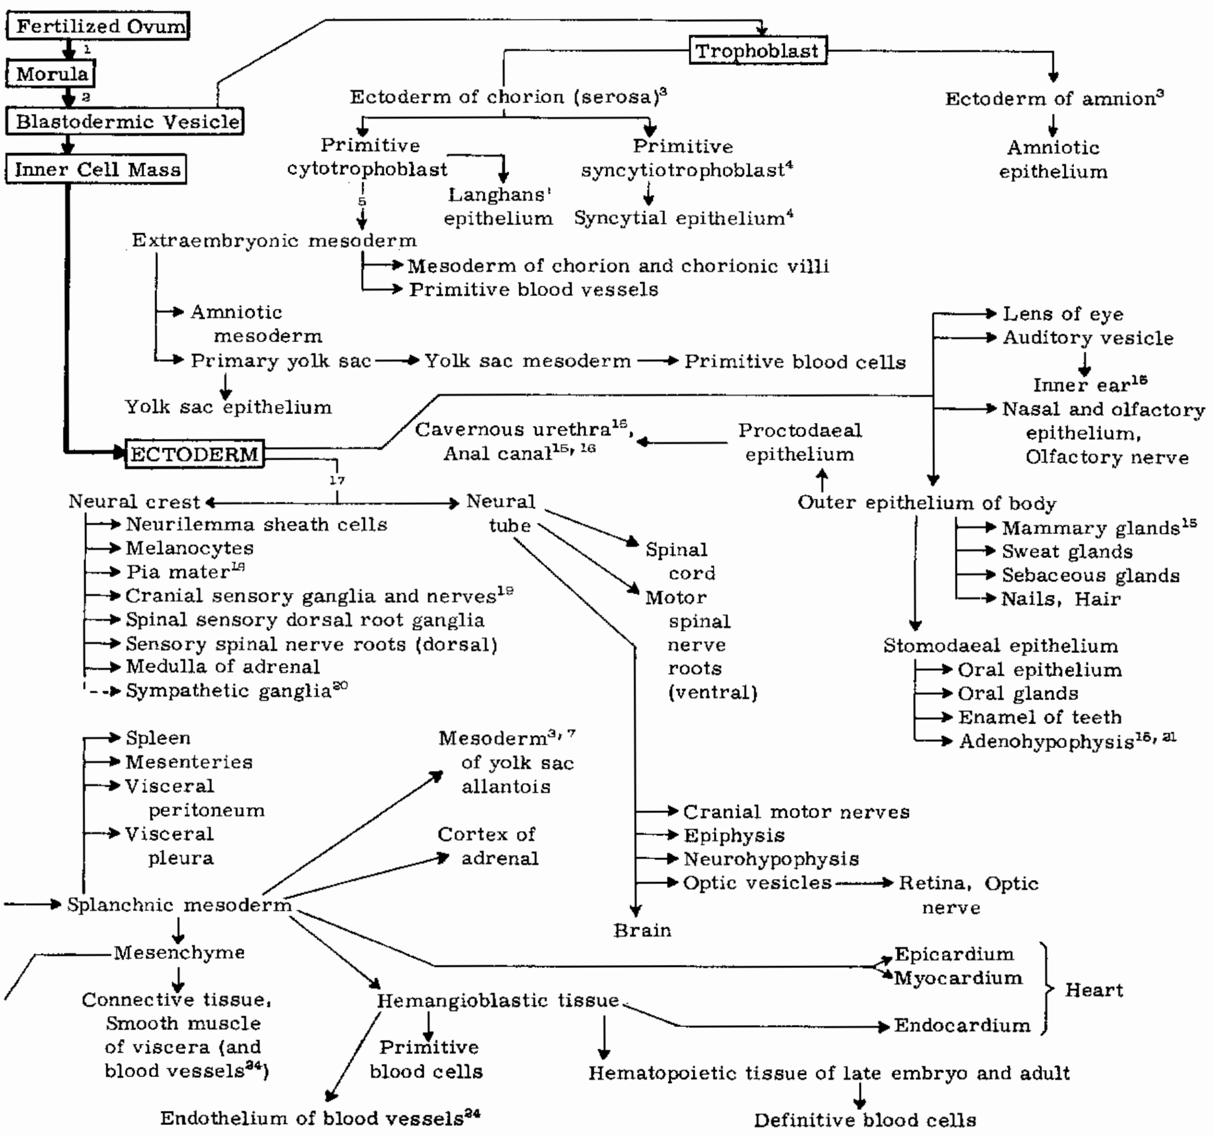
DERIVATIVES: EUTHERIAN MAMMALS

New York, 1953. Broken line indicates disputed origin.



/5/ In primates only. /6/ In man. /7/ Probably not in primates. /8/ Epithelial and glandular portion of structure structure; may form nucleus pulposus of intervertebral discs. /12/ Upper part. /13/ Or from splanchnic mesoderm remainder from mesoderm. /16/ In part only. /17/ In rostral areas of head, some mesenchyme comes in from the from mesenchyme. /19/ Evidence from lower vertebrates indicates that a portion of these ganglia and nerves may tuberalis, and pars intermedia of hypophysis. /22/ In region of somites only. /23/ Ventral and lateral part (evidence

26. TIME VARIATIONS IN DEVELOPMENTAL STAGES: MAMMALS AND BIRDS

In mammals, hours and days were counted from time of fertilization. In birds, one day was allowed for intrauterine development and added to the incubation age (lines 4-10). Sex differentiation most often occurs at Stage 30 but varies between Stages 28 (rat) and possibly 35 (opossum).

27. CHARACTERIZATION OF DEVELOPMENTAL STAGES

Part I. MAN

	Standard Stages (Witschi)	Streeter's Horizons	Age da	Size mm	Identification of Stages	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
					Neurula	
13	13	IX	20	1.5 (12.0)	Presomite neurula; spreading neural plate	9,22
14	14	X	21	2 (13)	Occipital somites 1-4; neural folds; invagination canal	10,17,23, 25
15	15	X	24	2.8 (16.0)	Cervical somites 5-12; neural tube starts forming	2,10,16, 18,21,22
16	16	XI	27	3.3 (22.0)	Thoracal somites 13-20; 2 visceral arches; upper and lower neuropores; germ cells start leaving yolk sac	8,26-28
17	17	XII	28	3.5	Thoracal somites 21-24; 3 visceral arches; oral membrane ruptures	3,14,26
					Tail-Bud Embryo	
18	18	XII	29	3.8 (24.0)	Lumbar somites 25-27; oral membrane resorbed; germ cells in hindgut and ventral mesentery	20,26,27
19	19	XII	30	4 (25)	Lumbar somites 28, 29; appendicular ridges	26,28
20	20	XIII	31	4.3 (26.0)	Sacral somites 30-32; arm and leg buds appear; germ cell migration reaches borders of mesonephric ridges	26-28
21	21	XIII	32	4.6 (27.0)	Sacral somites 33, 34; 4 visceral arches	26
22	22	XIII	33	4.8 (28.0)	Caudal somites 35, 36; otic vesicles detach	13,26
23	23	XIII	34	5 (29)	Caudal somites 37; slender yolk stalk	16,26
24	24	XIII	35	5.4 (30.0)	Caudal somites 38; lens placode; germ cells from hindgut to median mesonephric ridges	26,27
					Complete Embryo	
25	25	XIV	35-37	6 (28-35)	End of somite formation; arm and leg buds fully formed; regression of tail bud; germ cells in genital ridges, end of migration	4,12,26, 28
					Metamorphosing Embryo	
26	26	XV	38	8 (32)	Differentiation of hand plate; beginning of umbilical hernia	12,26
27	27	XVI	40	8-10 (35)	Visceral arches III and IV disappear under cervical fold and operculum; eyes pigmented; yolk sac separates from gut	26
28	28	XVII	42	12	Pentadactyl rudiments; closing of cervical sinus	26
29	29	XVII	44	12.5-14.0 (40.0)	Median processes of maxillaries advancing; chorionic villi longer where umbilicus attaches; cartilage formation in vertebrae	20,23,26, 28
30	30	XVIII	46	14.6	Premaxillary processes; beginning sexual differentiation of gonads	20,27,30
31	31	XVIII	48	15.6	Closing of facial clefts; hands and feet lateral to body wall	26,28
32	32	XIX	50	17	Phalanges, first links; hands, far apart, bending over heart; first ossification centers in mandible and clavicle	26
33	33	XX-XXII	56	22-25 (47)	Closed facial clefts; auricles rising; large umbilical hernia; arms and feet growing, fingers from left and right touch nose	26,28
					Fetus	
34	34	XXIII+	56-70	26-45	1st fetal stage: growth of eyelids; gut withdrawal from hernia; palatine raphe; differentiation of male and female external genitalia	12,16,26, 28,29
35	35		70-140	45-180	2nd fetal stage: periderm sealed eyelids; ossification of vertebral column begins; first ovocytes in ovaries; hair follicles; disc placenta	20,28,30
36	36		140-266	180-340	3rd fetal stage: resorption of periderm; cornification and separation of eyelids; lanugo; uterovaginal differentiation	20,28,29

Part II. RAT

Age (column B) = days after fertilization, calculated from copulation age minus 8 hours (corresponding ages of mouse embryos of the same stage, based chiefly on references 7 and 8, are given in parentheses). **Size** (column C) = largest dimension of embryo in natural position (largest and smallest dimensions of blastocysts and chorionic vesicles are given in parentheses).

	Standard Stages (Witschi)	Age da	Size mm	Identification of Stages
	(A)	(B)	(C)	(D)
				Cleavage and Blastula
1	1	1	0.07	1 cell (in oviduct)
2	2	2 (1)	0.08 x 0.06	2 cells (in oviduct)
3	3	3		4 cells (in oviduct)
4	4	3.25 (2)	0.08 x 0.05	8-12 cells (in oviduct)
5	5	3.5	0.08 x 0.04	Morula (in uterus)
6	6	4	(0.08 x 0.03)	Early blastocyst (in uterus)
7	7	5 (4)	(0.12 x 0.05)	Free blastocyst (in uterus)
				Gastrula
8	8	6 (4.5)	(0.28 x 0.07)	Implanting blastocyst, with trophoblastic cone and inner cell mass; outgrowth of endoderm (hypoblast)
9	9	6.75 (5)		Diplotrophoblast; inner cell mass (pendant), covered with endoderm
10	10	7.25 (5.5)	(0.3 x 0.1)	Near complete implantation; pendant begins differentiation into embryonic and extraembryonic parts
11	11	7.75 (6.5)	(0.5 x 0.1)	Completion of implantation; primary amniotic cyst; ectoplacental cone
				Primitive Streak
12	12	8.5 (7)	(1.04 x 0.26)	Connecting ectochorionic and amniotic cavities; rudiments of amniotic folds; primitive streak; start of 3rd layer formation; blastemas of heart and pericardium

27. CHARACTERIZATION OF DEVELOPMENTAL STAGES

Part II. RAT

	Standard Stages (Witschi)	Age da	Size mm	Identification of Stages
	(A)	(B)	(C)	(D)
				Neurula
13	13	9 (7.5)	1.0 (1.40 x 0.45)	Presomite neurula; fusion of chorioamniotic folds, chorioamniotic stalk; neural plate; embryo bent dorsally; bud of allantoic stalk
14	14	9.5 (7.75)	1.5 (1.8 x 1.1)	Somites 1-4 (occipital); pendant with 3 cavities: ectochorionic cyst, exocoelom, and amniotic cavity; ectochorionic cyst collapsing; allantoic stalk projects into exocoelom; embryo bent dorsally
15	15	10 (8.0 x 8.5)	2	Somites 5-12 (cervical); 1st visceral arch; ectochorionic cyst fused with ectoplacenta and allantoic stalk; regression of peripheral (distal) yolk sac and trophectoderm (diplotrophoblast); Reichert's membrane; gonia in endoderm; embryo bent dorsally
16	16	10.5 (8.5 x 9.0)	2.4 (2.2 x 3.4)	Somites 13-20 (upper thoracic); 2 visceral arches; disc and yolk-sac placentas; appendicular folds; embryo reverses, curves ventrally
17	17	11 (9.5)	3.3	Somites 21-25 (lower thoracic); yolk stalk closes at level of 15th somite; primary gonia in mesentery; primitive streak disappears; tail bud becomes organized; arm and leg buds recognizable
				Tail-Bud Embryo
18	18	11.5 (10)	3.8	Somites 26-28 (upper lumbar); 3 visceral arches; arm buds recognizable
19	19	11.75 (10.25)	4.2	Somites 29-31 (lower lumbar); visceral arches I-IV; cervical folds; appendicular folds and buds
20	20	11.875	5 (4.7 x 5.2)	Somites 32, 33 (upper sacral)
21	21	12	5.1	Somites 34, 35 (lower sacral); deep cervical sinuses
22	22	12.125 (10.5)	5.2	Somite 36 (1st caudal); olfactory pits
23	23	12.25	5.6 (4.5 x 5.8)	Somites 37, 38 (caudal); start of umbilical herniation
24	24	12.375	6	Somites 39, 40 (caudal)
				Complete Embryo
25	25	12.5 (11)	6.2	Somites 41, 42 (caudal); occipital somites dispersing; 4 visceral arches; deep cervical sinuses; arm buds at somite levels 8-14, about as high as long; leg buds at somite levels 28-31, smaller; body forms a spiral of about $1\frac{1}{2}$ turns, the left face and trunk applied to yolk sac, the right side turned toward placenta; tail and allantoic stalk rise to the placenta
				Metamorphosing Embryo
26	26	12.75	7	Somites 43-45 (caudal); mandibular, maxillary, and frontonasal processes; cervical sinuses closing; mammary welts; differentiation of hand plates; arm buds vascularized, brachial nerves entering; beginning of umbilical hernia
27	27	13 (12)	8	Somites 46-48 (caudal); prominent facial processes and clefts; nose-snout projecting; cervical sinuses closed; primordia of mammary glands; round hand plates and foot plates; larger umbilical hernia
28	28	13.5 (12.5)	8.5	Somites 49-51 (caudal); 1st visceral cleft transforms into external ear duct; precartilaginous condensations in hand plates
29	29	14	9.5	Somites 52-55 (caudal); auricular hillocks on visceral arches I and II
30	30	14.5 (13)	10.5	Somites 56-60 (caudal); body uncoils; mandibular precartilage; nearly round opening of external ear duct; pleuroperitoneal canal has become very narrow
31	31	15	12	Somites 61-63 (caudal); facial clefts closed; pleuroperitoneal canal closed; complete diaphragm
32	32	15.5 (14.5)	14.2 (14.3 x 8.0)	Somite 64 (caudal); pinna turns forward; maximal size of umbilical hernia
33	33	16 (15)	15.5	Somite 65 (usually this is last caudal); snout lifts off chest; last stage of metamorphosis
				Fetus
34	34	17-18 (16.0-16.5)	16-20	1st fetal stage: rapid growth of eyelids (eyes entirely covered at end of 18th day); palate complete; pinna covers ear duct; umbilical hernia withdraws

continued

27. CHARACTERIZATION OF DEVELOPMENTAL STAGES

Part II. RAT

	Standard Stages (Witschi)	Age da	Size mm	Identification of Stages
	(A)	(B)	(C)	(D)
				Fetus
35	35 ante-natal	19-22 (17-19)	20-40	2nd fetal stage: sealed eyelids; fetal membranes and placentas reach peak of development; tail grows to 10 mm; birth occurs (22nd day in rat, 19th day in mouse)
36	35 post-natal	1-16 (1-20) post-partum	40-100[1]	After birth, fetus becomes a breathing and suckling nestling[2]; during 1st 16 days (22-38 days total age), eyelids remain sealed and external ear ducts plugged with periderm
37	36 post-natal	17+ (21+) post-partum	100+[1]	Periderm seals of ears and eyelids vanish; active feeding begins within next 3 days and weaning after 1 week (total weaning age, 45-48 days for rats and mice)

/1/ Body length from nose to root of tail. During preimplantation stages, mouse development gains a lead of $1\frac{1}{2}$ to 2 days and maintains it until birth; its nestling period is correspondingly longer so that the average weaning age is nearly the same in the two species. /2/ Developmentally, nestling period belongs to second fetal stage.

27. CHARACTERIZATION OF DEVELOPMENTAL STAGES

Part IV. CHICK

Data adapted from Hamilton [2]. Times at which stages occur are approximate and are based on incubation temperature of 38°C.

	Standard Stages (Witschi)	Chick Stages[1]	Age	Identification of Stages
	(A)	(B)	(C)	(D)
				Before Laying
1	3,4	Early cleavage	3.5-4.5 hr[2]	Shell membrane of egg formed in isthmus of oviduct
2	5,6	During cleavage		Germ wall formed from marginal periblast
3	7	Late cleavage	4.5-24.0 hr[2]	Shell of egg formed in uterus
				After Laying
4	8,9	1		Preprimitive streak (embryonic shield)
5	10	2	6-7 hr	Initial primitive streak, 0.3-0.5 mm long
6	11	3	12-13 hr	Intermediate primitive streak
7	12	4	18-19 hr	Definitive primitive streak, ±1.88 mm long
8	13a	5	19-22 hr	Head process (notochord)
9	13b	6	23-25 hr	Head fold
10	14a	7	23-26 hr	1 somite; neural folds
11	14b	7 to 8-	ca. 23-26 hr	1-3 somites; coelom
12	14c	8	26-29 hr	4 somites; blood islands
13	15a	9	29-33 hr	7 somites; primary optic vesicles
14	15b	9+ to 10-	ca. 33 hr	8-9 somites; anterior amniotic fold
15	15c	10	33-38 hr	10 somites; 3 primary brain vesicles
16	16a	11	40-45 hr	13 somites; 5 neuromeres of hindbrain
17	16b	12	45-49 hr	16 somites; telencephalon
18	16c	13	48-52 hr	19 somites; atrioventricular canal
19	17a	13+ to 14-	ca. 50-52 hr	20-21 somites; tail bud
20	17b	14	50-53 hr	22 somites; trunk flexure; visceral arches I and II, clefts 1 and 2
21	17c	14+ to 15-	ca. 50-54 hr	23 somites; premandibular head cavities
22	17d	15	50-55 hr	24-27 somites; visceral arch III, cleft 3
23	18	16	51-56 hr	26-28 somites; wing bud; posterior amniotic fold
24	19	17	52-64 hr	29-32 somites; leg bud; epiphysis
25	20	18	3 da	30-36 somites extending beyond level of leg bud; allantois
26	21	19	3.0-3.5 da	37-40 somites extending into tail; maxillary process
27	22	20	3.0-3.5 da	40-43 somites; rotation completed; eye pigment
28	23	21	3.5 da	43-44 somites; visceral arch IV, cleft 4
29	24	22	3.5-4.0 da	Somites extend to tip of tail
30	25	23	4 da	Dorsal contour from hindbrain to tail is a curved line
31	26	24	4.5 da	Toe plate
32	27	25	4.5-5.0 da	Elbow and knee joints
33	28	26	5 da	1st 3 toes
34	29	27	5.0-5.5 da	Beak
35	30	28	5.5-6.0 da	3 digits, 4 toes
36	31	29	6.0-6.5 da	Rudiment of 5th toe
37	32	30	6.5-7.0 da	Feather germs; scleral papillae; egg tooth
38	33a	31	7.0-7.5 da	Web between 1st and 2nd digits
39	33b	32	7.5 da	Anterior tip of mandible has reached beak
40	34a	33	7.5-8.0 da	Web on radial margin of wing and 1st digit
41	34b	34	8 da	Nictitating membrane
42	34c	35	8.5-9.0 da	Phalanges in toes
43	34d	36	10 da	Length of 3rd toe from tip to middle of metatarsal joint = 5.4±0.3 mm; length of beak from anterior angle of nostril to tip of bill = 2.5 mm; primordium of comb; labial groove; uropygial gland
44	34e	37	11 da	Length of 3rd toe = 7.4±0.3 mm; length of beak = 3.0 mm
45	34f	38	12 da	Length of 3rd toe = 8.4±0.3 mm; length of beak = 3.1 mm
46	35a	39	13 da	Length of 3rd toe = 9.8±0.3 mm; length of beak = 3.5 mm
47	35b	40	14 da	Length of beak = 4.0 mm; length of 3rd toe = 12.7±0.5 mm
48	35c	41	15 da	Length of beak from anterior angle of nostril to tip of upper bill = 4.5 mm; length of 3rd toe = 14.9±0.8 mm
49	35d	42	16 da	Length of beak = 4.8 mm; length of 3rd toe = 16.7±0.8 mm
50	35e	43	17 da	Length of beak = 5.0 mm; length of 3rd toe = 18.6±0.8 mm

/1/ As described by Hamburger and Hamilton [1]. /2/ After ovulation.

27. CHARACTERIZATION OF DEVELOPMENTAL STAGES

Part IV. CHICK

	Standard Stages (Witschi)	Chick Stages[1]	Age	Identification of Stages
	(A)	(B)	(C)	(D)
				After Laying
51	35f	44	18 da	Length of beak = 5.7 mm; length of 3rd toe = 20.4±0.8 mm
52	36a	45	19-20 da	Yolk sac half-enclosed in body cavity; chorioallantoic membrane contains less blood and is "sticky" in living embryo
53	36b	46	20-21 da	Newly hatched chick

/1/ As described by Hamburger and Hamilton [1].

Part V. FROG

Data are principally for *Rana pipiens*. At a given stage, age and size can be expected to vary widely with differences in geographic strains and culture conditions. **Frog Stages** (column B), designated by Arabic numerals, are for the embryo at 18°C and are adapted from Shumway [18]; those designated by Roman numerals are for the larva at 20°C and are adapted from Taylor and Kollros [22].

	Standard Stages (Witschi)	Frog Stages	Age[1]	Size mm	Identification of Stages	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
					Cleavage and Blastula	
1	0	1	0	1.5-2.0	Unfertilized egg	18
2	1	2	1 hr	1.5-2.0	Fertilized egg; gray crescent	18
3	2	3	3.5 hr		2 cells	18
4	3	4	4.5 hr		4 cells	18
5	4	5	5.7 hr		8 cells	18
6	5	6	6.5 hr		16 cells	18
7	6	7	7.5 hr		32 cells	18
8	7a	8	16 hr		Middle blastula	18
9	7b	9	21 hr		Late blastula	18
					Gastrula	
10	8	10	26 hr		Early gastrula; dorsal lip stage	18
11	9, 10	11	34 hr		Middle gastrula; blastopore C- or U-shaped	18
12	11	12	42 hr		Late gastrula; yolk plug; primitive gut	16,18
					Neurula	
13	12	13	50 hr		Early neurula; medullary plate defined	10,16,18
14	13	14	62 hr		Midneurula; well-defined neural folds approaching each other; oral plate; anal pit; postanal gut	9,18
15	14, 15	15	67 hr		Late neurula; neural folds touch each other over most of their length; neurenteric canal; embryo rotates in jelly	9,18
16	16	16	72 hr	3	Neural tube, ectoderm fused over tube; oral sucker	18,19
					Tail-Bud Embryo	
17	17	17	84 hr	3.5	Tail bud; nasal pit; dorsal aorta	10,14,18
18	18	18	96 hr	4	Muscular response to stimulation of myotome; lens placode	18,19
19	19	19	118 hr	5	Heart beats; pronephros functional; Rohon-Beard cells; thyroid evagination	12,14,15, 18
20	20	20	140 hr	6	Embryo hatched; gill circulation; lens vesicle	18,19

/1/ Comparable ages in hours at 20°C for frog stages 2 through 20: 0.5, 2.3, 3.2, 4.0, 4.8, 5.6, 7, 17, 22, 28, 30, 38, 43, 49, 52, 61, 76, 88, and 96, respectively.

27. CHARACTERIZATION OF DEVELOPMENTAL STAGES

Part V. FROG

	Standard Stages (Witschi)	Frog Stages	Age	Size mm	Identification of Stages	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
					Tail-Bud Embryo	
21	21	21	162 hr	7	Mouth open; free-swimming; cornea becoming transparent; olfactory nerve; 2 rudiments of ventral pancreas; lung rudiments	14,18
22	22	22	192 hr	8	Circulation in tail fin; cartilaginous trabeculae; 2 gill slits are perforate; trabeculae carneae	14
23	23	23	216 hr	8-9	Opercular folds and labial teeth appear; spontaneous respiratory activity of mouth begins; basal plate	6,14,18
24	24	24	240 hr	9-10	Operculum closed on right side; adrenal cortex rudiment; respiratory rhythm begins	6,18,20
25	25a	25	284 hr	10-11	Operculum closed except for spiracle; rods and cones; germinal ridge; sucker regressed; rudiments of mesonephric tubules	4,16,18, 19
					Tadpole to Adult (Metamorphosis)	
26	25b	I	3 da	13	Feeding begins; rudiments of adrenal medulla and of hindlimb appear	17,22
27	25c	II	6 da	17	Lagena; neural lobe of hypophysis	1,23
28	25d	III	11 da	23	Limb bud of equal length and diameter; lateral motor column	3,22
29	26a	IV	19 da	33	Ovarial sac; cartilage in synotic tectum	4,14
30	26b	V	23 da	39	Limb bud twice as long as it is broad; distal half of bud is bent ventrad	22
31	26c	VI	26 da	43	Flattened paddle at distal end of limb bud; scapular cartilage; gonads distinguishable	14,22,24
32	27a	VII	31 da	50	Foot paddle indented between toes 4 and 5	22
33	27b	VIII	34 da	53	Urinary bladder rudiment; measurable thyroid hormone output	2,12,14
34	27c	IX	36 da	56	Separation of fat body from gonad; spontaneous limb twitches	14,22
35	27d	X	40 da	58	Indentations delimit toe margins; rudiments of fungiform papillae of tongue	7,22
36	28a	XI	43 da	61	Margin of 5th toe web directed toward toe 2	22
37	28b	XII	47 da	64	Margin of 5th toe web directed toward toe 1	22
38	28c	XIII	52 da	67	Margin of 5th toe web directed toward prehallux	22
39	28d	XIV	58 da	70	Rudiments of harderian glands; rudiments of skin glands	13,14
40	29a	XV	62 da	72	1st toe pads; hindlimbs take part in swimming	12,22
41	29b	XVI	64 da	73	Nictitating membrane a low fold anterior to eyeball	12
42	29c	XVII	67 da	73	Some skin glands patent; peritoneal thickening presages oviduct	4,13
43	30a	XVIII	70 da	74[2]	Cloacal tail piece resorbed; corneal reflex	11,22
44	30b	XIX	72 da	73	Tail regression begins; skin windows form	5,22
45	31	XX	74 da	70	Skin windows perforate; forelimbs emerge; oral beaks lost	5,22
46	32a	XXI	76 da	63	Upper lid forms; 1st molt	5,8
47	32b	XXII	79 da	44	Conjunctival sac complete; lateral lines regressing	8,22
48	33a	XXIII	81 da	33	Labial fringes completely lost; vasa efferentia	22,24
49	33b	XXIV	84 da	26	Tympanic membrane outlined; tail stub = 1-2 mm	22
50	33c	XXV	88 da	25[3]	Tail stub fully resorbed; oviduct extends nearly to cloaca	4,22
51	Juvenile	Juvenile	90+ da	25-70	Fully metamorphosed; gonads immature; urostyle	21,22
52	Adult	Adult	1-3 yr	60-110	Sexually mature	22

/2/ Maximum size highly variable; tadpoles over 100 mm long have been collected. /3/ Size upon completion of metamorphosis highly variable, ranging from 16 to 30 mm.

Part VI. SALMONID FISHES

Age (columns B-D) = days after fertilization (differences in the data of Witschi [W.], Pasteels [P.], and Lagler [L.] are due to the fact that speed of development varies widely according to temperature and other environmental factors). **Size** (column E) = length of embryo or fry (diameter of blastopore is given in parentheses). Size and Identification of Stages were compiled mostly from data in the references of Kopsch [2] and Witschi [12]. For information on development of other teleost species, consult references 1, 4, 5, 9-11.

	Standard Stages (Witschi)	Age da			Size mm	Identification of Stages
		W.[1]	P.	L.		
	(A)	(B)	(C)	(D)	(E)	(F)
						Cleavage
1	1					1 cell, fertilized
2	2	0.5		0.5		2 cells
3	3					4 cells
4	4			1		8 cells
5	5					16-32 cells
6	6	1				Blastodisc up to 500 cells
7	7	4		5	(1.5)	Disc blastula, hypoderm largely syncytial; blastocoele
						Gastrula
8	8		3		(1.6)	Start of invagination around dorsal blastopore lip; prospective prechordal mesoblast
9	9		3.2		(1.8)	Prospective upper notochord invaginated, small gastrocoele
10	10	5	3.5		(2)	Prospective mid-notochord and first somites invaginating
11	11		3.7		0.4 (2.2)	Prospective trunk notochord and somites invaginating; primitive node forming
						Primitive Streak
12	12		4	12	0.7 (2.5)	Prospective lower notochord and median neuroblast form primitive node (axial rudiment); prospective lateral neuroblasts and left and right mesoblasts meet in germ wall (lateral folds of primitive streak)
						Neurula
13	13	10	5	12	1.0 (3.1)	Presomite neurula; lateral primitive folds start concrescing
14	14		5.5		1.5 (3.7)	1-4 somites; neural plate narrowing, forming central solid cord of blastemic brain; upper notochord distinctly differentiated; hindgut vesicle
15	15	15	6	22	2.0 (4.5)	5-9 somites; forebrain and midbrain not separated, optic rudiments protruding; hindbrain narrow, imbedded between somitic mesoderm
16	16		6	68	2.5 (4.5)	10-15 somites; optic vesicles; forebrain and midbrain with slit-shaped cavity; otic vesicles with small cavity; concrescence constantly progresses, while yolk-sac epithelia spread over surface of yolk (in teleosts with small eggs, the yolk becomes much earlier engulfed by the yolk-sac epithelia; the yolk-sac blastopore may close even before any somites have become externally noticeable)
17	17	20	6.5		3.0 (3.5)	16-25 somites; indication of lens placodes over optic vesicles; 2 or 3 visceral arches externally recognizable

/1/ Approximates natural conditions near 5°C.

27. CHARACTERIZATION OF DEVELOPMENTAL STAGES

Part VI. SALMONID FISHES

	Standard Stages (Witschi)	Age da			Size mm	Identification of Stages
		W.[1]	P.	L.		
	(A)	(B)	(C)	(D)	(E)	(F)
						Tail-Bud Embryo
18	18		7	83	3.5 (0.01)	26-30 somites; yolk-sac blastopore closes, embryo measures $\frac{1}{4}$ of entire egg circumference and is in full length attached to yolk-sac epithelium; brain cavity prolongating into upper spinal cord; flat lens placodes over optic vesicles; otic vesicles with small cavity that opens at surface; flat solid pharynx with 2 "pouches" reaching surface epithelium, 2nd one breaking through; nephrotomes in pronephric region begin to organize
19	19	30			4	31-40 somites; short, free tail bud; rhombencephalic roof becomes thin and broad; widening of ventricle
20	20			86	4.5	40-50 somites; optic vesicles start invagination; lens placodes thicken
21	21	40			5.2	50-55 somites; foregut with pharyngeal pouches; olfactory placodes thicken; deep optic cups; rudiments of plug-shaped lens; nephric blastema-nephrostomes; nephric ducts get lost in lower mesonephric blastema cords; primordial germ cells widely scattered on both sides in mesodermal blastema; hindgut vesicle
22	22	50			6	55-58 somites; 2nd and 3rd pharyngeal pouches open on surface; pectoral limb buds; olfactory placodes saucer-shaped; free lenses in eye cups; round otic vesicle develops a thick neural epithelium ventrally; acoustic ganglion. Embryo begins to separate from yolk sac, especially the forehead; liver diverticles forming; tubular midgut; anus forming; nephric tubules and corpuscles; nephric ducts with free ends left and right of rectum.
23	23	60		86	10	58-60 somites; all somites have formed; pectoral fins fairly large and differentiated; buds of pelvic fins are present but not externally noticeable; eyes now heavily pigmented; otic vesicles become labyrinths; cartilaginous skeleton of head and upper body; germ cells still free in peritoneum or mesenchyme near nephric ducts and blastema; renal corpuscles; nephric ducts unite caudal to rectum
24	24	70			15	Hatching fish (fry); pelvic fin bud below caudal end of yolk sac (about 30th somite); anus at about 40th somite; total number of somites varies normally from about 56 to 60; swim bladder has grown out from dorsal wall of esophagus; undifferentiated gonads; skin pigment appearing
						Young Adult
25	25	80			20+	General appearance as at preceding stage, but pelvic and all unpaired fins are now well-differentiated; skin heavily pigmented; yolk sac shrinks and eventually disappears

/1/ Approximates natural conditions near 5°C.

Part II. INVERTEBRATES

	Class and Species	Common Name	Recorded Maximum Life Span	Reference
	(A)	(B)	(C)	(D)
	Chordata			
	Cephalochordata[1]			
1	*Branchiostoma lanceolatum*	Amphioxus	7 mo	6
	Ascidiacea			
2	*Ciona intestinalis*	Sea squirt	5 mo	11
	Echinodermata			
	Asteroidea			
3	*Asterias rubens*	Starfish	>5 yr	11
	Holothuroidea			
4	*Cucumaria planci*	Sea cucumber	>10 yr	11
	Arthropoda			
	Arachnida			
5	*Dermacentor andersoni*	Rocky Mountain wood tick	3-4 yr	7
6	*Tegenaria derhami*	Spider	4 yr	15
	Crustacea			
7	*Astacus fluviatilis*	Crayfish	30 yr	11
8	*Callinectes sapidus*	Blue crab	3 yr[2]	3
9	*Cyclops viridis*	Cyclops	10 mo[3]	20
10	*Daphnia magna*	Water flea	108 da	14
11	*Homarus gammarus*	European lobster	33 yr	9
	Insecta			
12	*Aedes geniculatus*	Mosquito	1 yr 6 mo	2
	Apis mellifera	Honeybee		
13		Queen	5 yr	11
14		Drone	6 mo	11
15		Worker	11 mo	11
16	*Cimex lectularius*	Bedbug (unfed)	6 mo	21
	Drosophila melanogaster	Fruit fly		
17		Normal	46 da	16
18		Vestigial	20 da	16
19	*Formica fusca*	Black ant (queen)	13 yr	11
20	*F. sanguinea*	Red ant (worker)	5 yr	11
21	*Lepisma saccharina*	Silverfish	2 yr	7
22	*Magicicada septendecim*	Periodical cicada	17 yr[3]	11
23	*Mantis religiosa*	Praying mantis	8 yr	13
24	*Melanoplus differentialis*	Differential grasshopper	3 mo	7
25	*Melolontha vulgaris*	June beetle (larva)	4-5 yr	11
26	*Musca domestica*	Housefly	76 da	9, 12
27	*Periplaneta americana*	American cockroach	4 yr 7 mo	8
	Insecta			
28	*Tribolium* spp.	Flour beetle	3 yr	7
	Symphyla			
29	*Scutigerella immaculata*	Garden symphylid	11-12 mo	7
	Annelida			
	Hirudinea			
30	*Hirudo medicinalis*	Medicinal leech	27 yr	9, 11
	Oligochaeta			
31	*Lumbricus terrestris*	Earthworm	6 yr	19
	Polychaeta			
32	*Nereis irrorata*	Clam worm	2 yr	5
	Mollusca			
	Cephalopoda			
33	*Loligo pealeii*	Squid	3-4 yr[2]	4
	Bivalvia			
34	*Mercenaria mercenaria*	Quahog	25-40 yr[2]	4
35	*Mytilus edulis*	Mussel	8-10 yr	4, 17
36	*Ostrea edulis*	Oyster	7-12 yr	17
37	*Pecten maximus*	Scallop	22 yr[2]	4
38	*Teredo navalis*	Shipworm	2 yr[2]	4
	Gastropoda			
39	*Acmaea dorsuosa*	Limpet	15 yr[2]	4
40	*Aplysia punctata*	Sea hare	1 yr[2]	4
41	*Doris* spp.	Sea lemon	1 yr	11
42	*Helix pomatia*	Land snail	18 yr[4]	11
43	*Littorina littorea*	Periwinkle	20 yr	4, 9
44	*Lymnaea* spp.	Freshwater snail	4-5 yr	11
	Polyplacophora			
45	*Ischnochiton magdalenensis*	Chiton	3-4 yr[2]	4
	Aschelminthes			
	Nematoda			
46	*Enterobius vermicularis*	Pinworm	2 mo	10
47	*Heterakis spumosa*	Rodent cecal worm	10 mo	18
48	*Loa loa*	African filarial worm	15 yr	18
49	*Necator americanus*	Hookworm	12 yr	18
50	*Rhabditis elegans*	Free-living roundworm	12 da	10
	Trichinella spiralis	Trichina worm		
51		Adults (in guinea pig)	5 wk	18
52		Cysts	30 yr	9

33. LIFE SPANS: POLLEN

For information on additional species, consult reference 1. Lyophilized (columns C and D) = freeze-drying followed by storage in nitrogen in an otherwise uncontrolled environment. **Temp.** (column C): "17.5; 21" indicates that tests were conducted at temperatures averaging 17.5°C during the winter and 21°C during the summer. **Relative Humidity** (column D): 0 indicates lack of humidity due to storage over concentrated sulfuric acid in desiccator, unless otherwise specified; A = air; A-D = air-dry; Un = uncontrolled. **Viability** (column E) was based on germination tests made on artificial media at age given in column F.

34. GROWTH RATES: PLANT TISSUES

Nutrient fluids used in plant tissue cultures are chiefly composed of chemicals. **Culture Medium** (column C): GA = Gautheret's agar; CM = coconut milk (liquid endosperm of *Cocos nucifera*); IAA = indoleacetic acid; HA = Hildebrandt's agar; WL = White's liquid; WA = White's agar; WAS = modified White's agar for sunflower tissues; HAS = modified Hildebrandt's agar for sunflower tissues; WAT = modified White's agar for tobacco tissues; BL = Bonner's liquid; BNA = Burkholder-Nickell agar. **Relative Increase** (column F): W_1/W_0 = final weight divided by initial weight. **Relative Growth Rate** (column G): r = instantaneous growth rate expressed as percent increase/day.

	Species (Common Name)	Tissue	Culture Medium	Growth Period da	Initial Weight mg	Relative Increase W_1/W_0	Relative Growth Rate 100 r	Reference

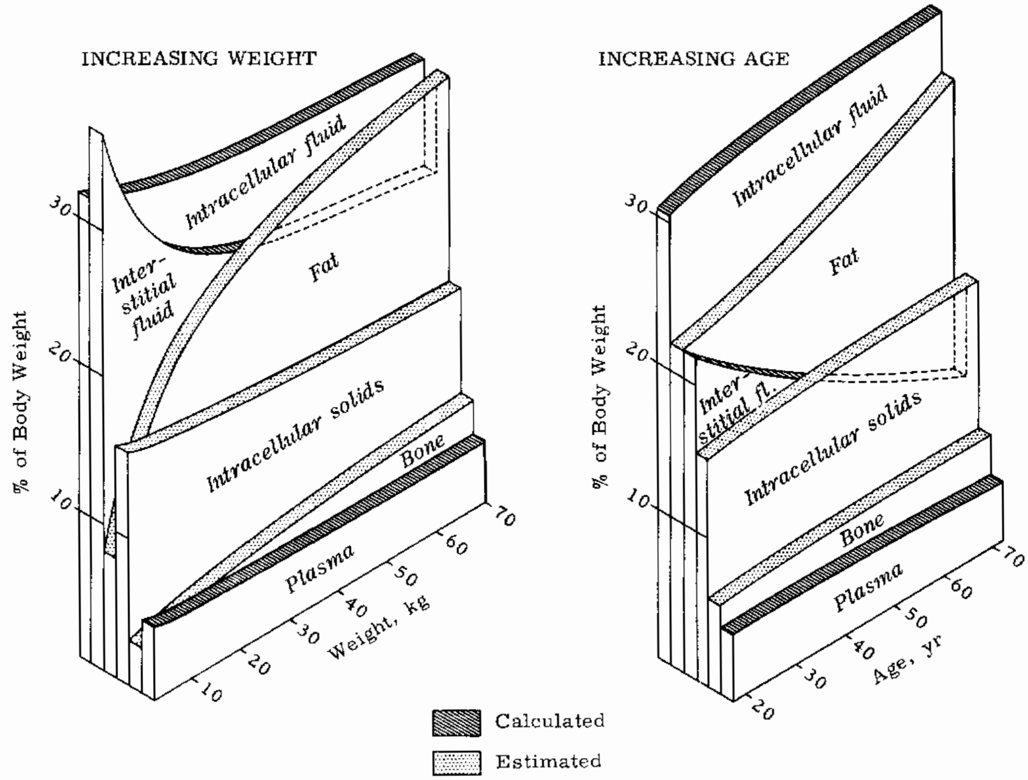
IV. MORPHOLOGY

35. BODY COMPOSITION WITH INCREASING WEIGHT AND AGE: MAN

Method of determination: ***Interstitial fluid*** calculated by subtracting plasma volume from thiocyanate diffusion space.[1] ***Intracellular fluid*** calculated by subtracting thiocyanate diffusion space[1] from total body water. ***Intercellular solids***[2] estimated by the method of McCance [2] (intracellular water = 67% intracellular mass). ***Bone***[2] estimated from the data of Iob and Swanson [1], Mitchell [3], Shohl [4], and Widdowson [5]. ***Fat***[2] estimated by difference between total body weight and all other components.



/1/ The use of thiocyanate diffusion space as a measure of extracellular fluid is based on the probability that in normal persons the thiocyanate and other similar diffusion spaces are in fairly constant proportion in that nebulous entity, extracellular fluid, and that therefore the rate of change of the curves should not vary (although the absolute values may). /2/ Because of the lack of data, values indicate order of magnitude only.

Part II. CONSTANTS FOR USE IN SURFACE AREA FORMULA: MAMMALS

K-values were derived from surface area values taken from extensive literature sources, using the formula $K = \frac{\text{area (sq cm)}}{\text{weight } 2/3 \text{ (g)}}$. Method (column D): P = perimeter; S = skinning; T = triangulation; M = mold; C = paper cover; I = surface integrator. Values in parentheses are ranges, estimate "c" for body weight (column E) and "d" for K-value (column F) (cf. Introduction).

	Species	Common Name	Subjects no.	Method	Body Weight g	K-Value Constant	Reference
	(A)	(B)	(C)	(D)	(E)	(F)	(G)
1	*Balaenoptera physalus*	Finback whale	3	P	160,000(115,000-220,000)	8.3(7.5-8.9)	19
2			1	P	43,000,000	11.1	19

Part I. REGIONS AND FUNCTIONS

		Region (A)	General Functions (B)	Sub-regions (C)	Specific Functions (D)
	PROSENCEPHALON	Telencephalon			
1		Cerebral cortex	Highest level of integration; symbolism, memory, forecasting	Prefrontal, frontal, parietal, occipital, temporal	Association: autonomic, general motor, sensory, visual, auditory.
2		Rhinencephalon	Olfaction, "visceral brain," emotion	Olfactory bulb, cortex; amygdala; limbic cortex of hippocampus; fornix; mammillary body	Association: autonomic-visceral integration; olfaction.
3		Corpus striatum	Smoothing of motor behavior; inhibition of posture, movement patterns, extrapyramidal relay	Caudate nucleus, putamen, globus pallidus	Motor relay (globus pallidus) back to cortex into thalamus.
		Diencephalon			
4		Epithalamus	"Drive"	Habenular nucleus	
5		Thalamus	Sensory relay to cortex; thalamocortical circuits	Anterior, midline, medial, lateral, posterior, pulvinar, ventral	Cortical relay nuclei: anterior, emotion (?); medial and ventral, sensory; pulvinar, gnostic and practic. Unspecific intralaminar nuclei. Basal ganglia relay ventrolateral.
6		Metathalamus		Medial, lateral geniculate	Medial: acoustic to supratemporal plane. Lateral: visual to striate area.
7		Subthalamus	Motor, extrapyramidal	Subthalamic nucleus	Integrative facilitation and inhibition.
8		Hypothalamus	Principal forebrain center for integration of visceral functions involving autonomic nervous system[1]	Anterior, middle, lateral, posterior	Generally anterior part, trophotropic (parasympathetic); posterior part, ergotropic (orthosympathetic).
9	MESENCEPHALON		Postural reflexes; nuclei for cranial nerves	Superior colliculus, inferior colliculus, substantia nigra, red nucleus, tegmentum, reticular formation (part of), basis pedunculi, nucleus nerves III, IV, V (part of)	Relay for visual reflexes (protective), auditory reflexes, extrapyramidal junction of striatal and cortical influences; contributes to righting reflexes, tracts; facilitatory and inhibitory influences on motor performance.
	RHOMBENCEPHALON	Metencephalon			
10		Cerebellum	Maintenance of posture; equilibrium; coordination, smoothing of complex movements	Corpus cerebelli, anterior and posterior lobe; flocculonodular lobe	Paleocerebellum: equilibration, maintenance of posture. Neocerebellum: postural reflexes, stabilizing, smoothing more complex movements initiated in cortex, facilitation of posture change.
11		Pons		Pontine nucleus, reticular formation, cerebellar peduncles, tracts, nucleus nerve V (part of)	Relay between cerebro-cerebellar, motor inhibitory areas.
		Myelencephalon			
12		Medulla oblongata	Reflex center for cardiac vasomotor, vomiting, deglutition, respiratory, gustatory, facial reflexes	Nucleus nerves V (part of), IX, XI, XII; inferior olivary; tracts; reticular nuclei of medullary tegmentum	Posture.

/1/ Energy and water exchange, sexual function, sleep, vasomotor.

Part II. CORTICAL CEREBRAL REGIONS AND FUNCTIONS

Area (column C): numbers indicate areas of Brodmann.

	Gross Region	Location	Area	Principal Connected Pathways and Areas	Function
	(A)	(B)	(C)	(D)	(E)
1	Occipital (striate cortex)		17	Optic radiation; lateral geniculate body of the thalamus; optic tract; chiasm; optic nerve; retina	Vision
2	Occipital (parastriate) and parietal (preoccipital)		18,19	Superior colliculus of brain stem; areas 37, 8, 23, 21 of Brodmann; opposite hemisphere (areas 18, 19)	Visual elaboration
3	Temporal (Heschl's gyrus)		41	Auditory radiation; medial geniculate body; inferior colliculus; nucleus of lateral lemniscus; superior olive; dorsal and ventral cochlear nucleus in brain stem; cochlear nerve; spiral ganglion; hair cells in organ of Corti	Hearing (auditosensory)
4	Temporal		42,22		Hearing (auditopsychic)
5	Temporal (piriform area)		28,34	Lateral root; olfactory tract; olfactory bulb; fila olfactoria	Olfaction
6	Parietal (post central convolution)		3,1,2	Connected through posteroventral nuclei with mesial and trigeminal fillets and spinothalamic tract; dorsal root; sensory root ganglion; peripheral sensory nerves	Somatic sensation
7	Parietal (superior lobule)		$5,7_a$	Dorsolateral thalamus; association fibers connecting areas 1, 44, 19, 8, 46 of Brodmann	Sensory elaboration (motor skills)
8	Frontal (pons triangularis and opercularis); dominant hemisphere; Broca's area		44,45	Receives afferents from area 3 of Brodmann; sends impulses to areas 4 and 5	Speech (motor)
9	Parietal (lower lobule); dominant hemisphere; Wernicke's area		40,39	Association fibers connecting areas 1, 42, 19 of Brodmann	Speech (sensory) (Gnosia)

Part II. CORTICAL CEREBRAL REGIONS AND FUNCTIONS

	Gross Region	Location	Area	Principal Connected Pathways and Areas	Function
	(A)	(B)	(C)	(D)	(E)
10	Temporal		21,22	Frontal and parietal association areas (areas 11, 12, 13, 39, 40 of Brodmann)	Memory
11	Frontal	 	9,10,11, 12,13, 14,24	Orbitofrontal cortex (areas 9,10,11,12 of Brodmann) and posterior and medial orbital gyri (areas 13 and 14 of Walker) are connected to dorsomedial nuclei of thalamus which has hypothalamic connections; the anterior cingulate gyrus (area 24) is projection area of anterior nuclei of thalamus	Projection of conscious thought
12	Frontal (precentral area, motor and premotor)	 	4,6	Internal capsule, pyramidal decussation, corticospinal tracts, anterior horn cells, motor roots; connected by way of lateroventral nucleus and the superior cerebellar peduncle with spinocerebellar afferents	Motion (motor activity)

Part III. NUCLEI OF METATHALAMUS AND DORSAL THALAMUS

Function (column B): A = associational; D = diffuse associational; I = internal relay; E = external relay; U = unclassified or doubtful.

	Nucleus	Function	Afferents	Efferents	Reference
	(A)	(B)	(C)	(D)	(E)
1	Medialis dorsalis	A	Principal: some from medioventral region (hypothalamus)	Frontal granular cortex.	2,4,16,19
2	Lateralis posterior	A	Principal: parietal cortex. Diffuse: sensorimotor, limbic, auditory, visual, frontal cortexes. From nuclei 5-9 in this table.	Parietal field.	2,4,10,13, 16,18, 19
3	Lateralis anterior	A	Principal: parietal cortex. Diffuse: sensorimotor, auditory, visual cortexes. From nuclei 5-9 in this table.		
4	Pulvinar	A	Principal: parietal association. Diffuse: frontal, sensorimotor, limbic, auditory, visual cortexes. Subcortical: ventral posterior nucleus of thalamus. From nuclei 5-9 in this table.	Posterior parietal and temporal cortex, superior parietal lobule, posterior Sylvian region, supramarginal gyrus, temporo-occipital region, cortical area 18, superior colliculus and pretectum, posterior parietal, temporal and occipital (parasensory) fields.	2,4,10,11, 13,16, 18-20
5	Centrum medianum	D	Subcortical: reticular formation; other intralaminar[1] thalamic nuclei	Subcortical: caudate nucleus, corpus striatum.	2,4,7,8, 12,16-18

/1/ Denotes nuclei not only adjacent to internal medullary lamina of thalamus but also others (such as midline nuclei, reticularis anterior and ventralis anterior) which, when stimulated, can evoke cortical and intrathalamic recruiting responses.

Part III. NUCLEI OF METATHALAMUS AND DORSAL THALAMUS

	Nucleus	Function	Afferents	Efferents	Reference
	(A)	(B)	(C)	(D)	(E)
6	Centralis medialis	D	Reticular formation; intralaminar thalamic nuclei	Cortical associational areas: frontal, cingulate, orbital caudate nucleus.	2,4,7,8, 16-18
7	Centralis lateralis				
8	Ventralis anterior				
9	Reticularis anterior	D	Reticular formation; other intralaminar thalamic nuclei		
10	Anterodorsalis	I	Corresponding opposite nucleus	Retrosplenial region	2,4,16,19, 20
11	Anteromedialis	I	Mammillothalamic tract; limbic cortex. From nuclei 5-9 in this table.	Anterior gyrus cinguli	2,4,13,16, 18,20
12	Anteroventralis	I	Subcortical: from nuclei 5-9 in this table; mammillothalamic tract. Cortical: gyrus cinguli.	Posterior gyrus cinguli	2,4,13,16, 18,19
13	Ventral anterior	I	Principal: globus pallidus. Diffuse: orbital, parietal, frontal, sensorimotor, limbic cortexes. From nuclei 5-9 in this table.	Globus pallidus; prefrontal cortex	2,4,5,9, 13,16,18
14	Ventralis lateralis	I	Principal: superior cerebellar peduncle	Precentral motor cortex, areas 4 and 6. Brachium conjunctivum.	2,4,9,16, 19,20
15	Ventral medial	I		Globus pallidus; lateral frontal cortex	2,4,9,16
16	Medial geniculate body	E	Inferior colliculus and parabigeminal body; auditory cortex	Auditory cortex; parvicellular and magnocellular to temporal cortex in lower wall of Sylvian fissure	2,4,15,16
17	Lateral geniculate body	E	Ganglion cell layer of retina		2,4,16
18	Ventral posterolateral	E	Medial lemniscus; spinothalamic tract; sensorimotor cortex	Sensorimotor cortex	2-4,6,13, 14,16
19	Ventral posteromedial	E	Trigeminal lemniscus; trigeminal thalamic tract	Sensorimotor cortex	2,4,16
20	Reticularis lateralis (posterior)	U	Unclassified or doubtful	Cortex	1,2,4,16, 20
21	Midline[2]	D or U	Spinothalamic tract; medial lemniscus	Hypothalamus; basal ganglia; lateral thalamus nuclei	2,4,16-18,20

/2/ Midline nuclei: rhomboideus, reuniens, paracentralis, parafascicularis, paraventricularis (anterior and posterior), parataenialis.

37. BRAIN: MAN

Part IV. TRACTS

Abbreviations: C = cervical; S = sacral; T = thoracic.

	Tract	Origin	Termination	Pathway	Function
	(A)	(B)	(C)	(D)	(E)
1	Allen's fasciculus[1]	Solitary nucleus	Ventral column: C 3-T 6	Lateral funiculus along dorsolateral edge of ventral column	Associated with respiratory control
2	Arcuate fasciculus	Cerebral cortex of basal frontal lobes	Cortex of temporal, lower parietal, and occipital regions	Through base of angular gyrus into interior and middle frontal gyri; in parietal and frontal opercula over upper border of insula	Association bundle
3	Central acoustic	Contralateral and homolateral cochlear nucleus and olivary complex; nuclei of central acoustic tract	Medial geniculate body, inferior colliculus	With lateral lemniscus to ventrolateral surface of inferior colliculus; runs in brachium of inferior colliculus	Auditory
4	Corticospinal, lateral	Cerebral cortex	Contralateral anterior horn of spinal cord	Internal capsule; cerebral peduncle; decussation of pyramids, lateral corticospinal tract	Motor
5	Corticospinal, ventral	Cerebral cortex	Ipsilateral anterior horn of cord	Internal capsule; peduncle, ventral corticospinal tract about anterior median fissure of cord	Motor
6	Cuneate fasciculus	Dorsal root ganglia of C 1-T 6	Cuneate nucleus	Lateral portion of dorsal funiculus above T 6	Proprioception; discriminative touch (upper extremities)
7	Dorsolateral fasciculus (Lissauer)	Dorsal root fibers, fibers from substantia gelatinosa and dorsal horn of gray matter	Substantia gelatinosa (Rolando), nucleus proprius within 2-4 segments	Dorsolateral to substantia gelatinosa of dorsal horn of gray matter	Pain, temperature, and some tactile
8	Fastigiobulbar fasciculus	Fastigial nuclei	Reticular formation of medulla	Mingled with uncinate fasciculus of Russel in juxtarestiform body	Cerebellar inhibitory path from vermis bulbar reticular substance
9	Frontal fasciculus, superior (Burdach)	Basal frontal regions of cortex	Temporal, lower parietal, and occipital cortex	Dorsal to insula	Association fibers
10	Frontopontine fasciculus	Posterior part of superior and middle frontal gyri bordering on precentral gyrus	Pontine nuclei	Extreme medial and lateral portions of cerebral peduncle	Cortical relay fibers to middle lobe of cerebellum
11	Fasciculus gracilis (Goll)	Dorsal root ganglia of T 6-S 5	Nucleus gracilis	Medial portion of dorsal funiculus	Proprioception; discriminative touch (lower extremities)
12	Habenulopeduncular fasciculus[2]	Habenular nuclei	Interpeduncular nucleus	Runs ventrolaterally; arches beneath centrum medianum through medial border of red nucleus and along midventral line	
13	Habenulotegmental	Habenular nuclei	Dorsal tegmental nucleus		
14	Hypothalamic, descending[3]	Dorsomedial nuclei, posterior and lateral hypothalamic areas, perifornical areas	Autonomic cells in medulla oblongata and intermediolateral cell column of cord	Descends between mammillary body and red nucleus to ipsilateral reticular formation; dorsal to substantia nigra, then to region of vestibular fiber complex	
15	Interfascicular fasciculus (Schultze)	Descending fibers of posterior funiculus	Nucleus proprius of gray matter	Between, and mingled with, fasciculus gracilis and cuneatus	Reflex collaterals
16	Interstitiospinal (Cajal)	Mesencephalon, region of posterior commissure	Intermediolateral cell column of cord (C 8-T 1)	Descends along ventromedian sulcus of cervical cord	
17	Laterocerebellar	Lateral reticular nucleus of medulla	Cerebellum	Runs with external arcuate fibers	

/1/ Solitariospinal. /2/ Retroflex bundle of Meynert. /3/ Not yet demonstrated anatomically.

37. BRAIN: MAN

Part IV. TRACTS

	Tract	Origin	Termination	Pathway	Function
	(A)	(B)	(C)	(D)	(E)
18	Longitudinal fasciculus, dorsal (Schütz)	Hypothalamus and dorsal tegmental nucleus	Somato-motor and autonomic motor nuclei of brain stem	Continue into ventral fasciculus proprius of cord	
19	Longitudinal fasciculus, inferior	Occipital cortex	Temporal cortex		Association fibers
20	Longitudinal fasciculus, medial	Mesencephalon, at level of posterior commissural nuclei	Through medulla, continued in cord as sulcomarginal fasciculus of Marie	Bilateral, about midventral line between central gray matter and tectospinal fasciculus (in medulla)	Contains vestibular reflex fibers, fibers from reticular nuclei, abducens nucleus
21	Mammillary fasciculus	Medial mammillary nuclei	Anterior thalamic nuclei and tegmentum	Runs dorsally from mammillary bodies, then bifurcates; one limb continues dorsally, the other caudally	
22	Mammillotegmental fasciculus	Medial and lateral mammillary nuclei	Tegmentum	Initially a component of the principal mammillary fasciculus which it leaves to run caudally	
23	Mammillothalamic fasciculus (Vicq d'Azyr)	Medial and lateral mammillary nuclei	Anterior nuclear mass of thalamus	Dorsorostrally through medial thalamic wall	
24	Olfactory	Olfactory bulb	In three striae: medial, intermediate, and lateral olfactory	Lies between gyrus rectus and medial orbital gyrus, covering olfactory sulcus	Olfaction
25	Olivocochlear bundle	Nuclei of olivary complex	Organ of Corti	Via auditory nerve	Inhibition of neural response from organ of Corti
26	Optic	Ganglion cells of retina	Lateral geniculate and/or superior colliculus	Tract encircles thalamus ventrally	Vision
27	Perpendicular fasciculus	Inferior parietal lobule	Fusiform gyrus	Obliquely dorsomedial and ventrolateral	Association
28	Probst's	Sensory cells associated with nucleus of cranial nerve V in area of cerebral aqueduct or lateral reticular nucleus of mesencephalon	Intercalated nucleus and dorsal vagal nucleus	Ventrolateral to solitary fasciculus, dorsomedial to nucleus of spinal tract of cranial nerve V	Appears to link various parts of trigeminal system; relating masticatory movements with salivation
29	Reticulospinal fasciculus, lateral, direct	Reticular substance	Gray matter of cord	Lies in region of overlap of lateral cortico- and rubro-spinal tracts	Extrapyramidal aspects of motor function
30	Reticulospinal fasciculus, ventral, crossed	Reticular substance	Gray matter of cord	Ventrolateral to ventral corticospinal fibers	Extrapyramidal aspects of motor function
31	Rubrospinal	Red nucleus	Gray matter of cord	Ventromedial to, and overlapping, lateral corticospinal tract	Extrapyramidal function
32	Septomarginal fasciculus	Collaterals of dorsal funiculus fibers (fasciculus cuneatus)	Gray matter of cord	Along posterior median sulcus in middle of posterior funiculus	Proprioceptive reflex connections
33	Solitary fasciculus	Fibers from cranial nerves VII, IX, and X	Solitary nucleus	Dorsomedial to spinal root of cranial nerve V; extends from level of medullary stria to caudal end of medulla	Visceral afferent; oral and concerned with taste
34	Spinal trigeminal	Cells of trigeminal nerve	Nucleus of spinal trigeminal tract	Ventromedial to restiform body; in position of Lissauer's zone	Pain, temperature, and some tactile from face

continued

37. BRAIN: MAN

Part IV. TRACTS

	Tract	Origin	Termination	Pathway	Function
	(A)	(B)	(C)	(D)	(E)
35	Spinocerebellar fasciculus, ventral	Border cells about medial border of centralateral ventral column, cells about dorsal nucleus of Clark	Vermis of anterior lobe of cerebellum	On periphery of cord ventral to dorsal spinocerebellar, and lateral to lateral spinothalamic tract	
36	Spinocerebellar fasciculus, dorsal (Flechsig)	Dorsal horn and dorsal nucleus of Clark	Cortex of anterior cerebellar lobe, uvula and pyramis of vermis	On periphery of lateral funiculus of cord	
37	Spinoolivary (Helweg)	Dorsal horn of spinal cord	Inferior olive	Ventral and superficial part of lateral funiculus between lateral and ventral spinothalamic tracts	
38	Spinothalamic, ventral[4]	Dorsal horn of gray matter (substantia gelatinosa)	Posterolateral ventral nucleus of thalamus	Lateral funiculus just medial to ventral spinocerebellar tract	Pain and temperature from extremities and trunk
39	Spinothalamic, ventral	Proper nucleus of contralateral dorsal horn	Posterolateral ventral nucleus of thalamus	Lateral portion of ventral funiculus	Light touch
40	Subcallosal fasciculus	Frontal cortex	Striate body	Dorsal to caudate nucleus below radiation of corpus callosum	
41	Tectospinal (Lowenthal)	Superior colliculus	Spinal gray matter	Ventromedial portion of ventral funiculus	Head and shoulder reflex movements to light and sound
42	Tegmental fasciculus, central	Variable composition		In reticular formation of medulla lateral to crossed vestibulospinal tract	
43	Tegmental fasciculus, central (part of)	Central gray matter of cerebral aqueduct	About sac of inferior olive	Flattened bundle running through tegmentum, oblique to horizontal plane, ventrolateral to medial longitudinal fasciculus	
44	Thalamic fasciculus	Fibers of brachium conjunctivum going to thalamus through tegmental field of Forel; fibers from globus pallidus	Thalamus; nucleus (ventralic anterior and ventralic lateralis)	Ventrally through Forel's field H_1, between mammillothalamic tract and lenticular fasciculus	
45	Vestibulofastigial	Vestibular nuclei and spinal nucleus of cranial nerve V	Fastigial nucleus and vermian cortex	Between restiform body and periventricular gray matter in juxtarestiform body	
46	Vestibuloflocculonodular	Cells of origin in vestibular ganglion (Scarpa)	Cortex of flocculus, nodulus of cerebellum		Vestibular
47	Vestibuloglobose	Vestibular nuclei and spinal nucleus of cranial nerve V	Globose nucleus and vermian cortex	Between restiform body and periventricular gray matter in juxtarestiform body	
48	Vestibulospinal, crossed, ventral	Medial, inferior, and spinal vestibular nuclei	Gray matter of cord	Medial portion of ventral funiculus in sulcomarginal fasciculus of Marie	Vestibular reflex
49	Vestibulospinal, direct, lateral	Lateral vestibular nucleus	Gray matter of cord	Ventrolateral part of ventral funiculus and ventromedial portion of lateral funiculus	Vestibular reflex

38. AUTONOMIC NERVOUS SYSTEM: MAN

Both sympathetic and parasympathetic pathways contain afferent and efferent fibers, and the pathways are associated generally with the same viscera or vessels. Afferent sympathetic nerve cells are located in dorsal spinal nerve root ganglia. Their peripheral processes run in visceral and vascular nerves; their central processes enter the cord through dorsal nerve roots. Segmental numbers of nerve roots transmitting afferents from any viscus correspond usually to segments containing preganglionic neurones for that structure. Afferent parasympathetic nerve cells lie in root ganglia of cranial nerves V, VII, IX, and X, which are homologues of dorsal spinal root ganglia. Their peripheral processes run in the nerves indicated and carry impulses from glands and vessels; their central processes enter the brain stem. Afferent parasympathetic fibers from pelvic structures (cervix uteri, base of bladder, prostate, and rectum) are carried in the pelvic splanchnic nerves to the cord. Autonomic afferents participate in segmental reflex arcs. Relays also ascend in tracts in the anterolateral and posterior white columns of the cord to the brain stem and hypothalamus, where they may end or are further relayed to cortical levels, e.g., in the frontal lobes of the brain.

38. AUTONOMIC NERVOUS SYSTEM: MAN

Part I. SYMPATHETIC CONNECTIONS

	Organ	Effector	Preganglionic Neurones		Postganglionic Neurones		Actions	Reference
			Cell Body	Pathway	Cell Body	Distribution		
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
17	Submaxillary and sublingual glands	Gland and vessels	T 1, 2, 3	WRC, ST	Superior cervical ganglion	External carotid plexus and branches	Vasoconstriction, weak secretion	1,8
18	Parotid gland	Gland and vessels	T 1, 2, 3	WRC, ST	Superior cervical ganglion	External carotid plexus and branches	Vasoconstriction, weak secretion ?	1,8
19	Lower esophagus	Smooth muscle	T 1-3, 4-6	WRC, ST (greater splanchnic)	Stellate, upper thoracic, and celiac ganglia	Esophageal rami and plexus, left gastric and phrenic nerves	Inhibits peristalsis	6
20	Cardiac sphincter	Smooth muscle	T 1-3, 4-6	WRC, ST (greater splanchnic)	Stellate, upper thoracic, and celiac ganglia	Esophageal rami and plexus, left gastric and phrenic nerves	Contraction	6
21	Stomach	Smooth muscle and gland	T 5, 6-10, 11	WRC, ST (thoracic splanchnic)	Celiac ganglion	Accompanies gastric and gastroepiploic arteries	Inhibits peristalsis	5,14
22		Pyloric sphincter	T 5, 6-10, 11	WRC, ST (thoracic splanchnic)	Celiac ganglion	Accompanies right gastric artery	Contraction	
23		Blood vessels	T 5, 6-10, 11	WRC, ST (thoracic splanchnic)	Celiac ganglion	Accompanies gastric and gastroepiploic arteries	Vasoconstriction	
24	Pancreas	Gland	T 5, 6-10, 11	WRC, ST (thoracic splanchnic)	Celiac ganglion	Accompanies pancreatic arteries	Secretion ?	4
25		Blood vessels	T 5, 6-10, 11	WRC, ST (thoracic splanchnic)	Celiac ganglion	Accompanies pancreatic arteries	Vasoconstriction	5,14
26	Liver	Blood vessels	T 5, 6, 7-10	WRC, ST (splanchnic)	Celiac ganglion	Periarterial plexus of hypogastric artery	Vasoconstriction	5,14
27	Gallbladder	Smooth muscle	T 5, 6, 7-10	WRC, ST (splanchnic)	Celiac ganglion	Periarterial plexus of hepatic and cystic arteries	Relaxation	5,14
28		Sphincter of common bile duct	T 5, 6, 7-10	WRC, ST (thoracic splanchnic)	Celiac ganglion	Periarterial plexuses	Contraction	
29	Small intestine and proximal colon	Smooth muscle and glands	T 5, 6-10, 11	WRC, ST (thoracic splanchnic)	Celiac and superior mesenteric ganglia	Celiac and superior mesenteric rami	Secretion (?), inhibition	5,14
30	Ileocecal sphincter	Blood vessels and sphincter muscle	T 5, 6-10, 11	WRC, ST (thoracic splanchnic)	Celiac and superior mesenteric ganglia	Celiac and superior mesenteric rami	Vasoconstriction, contraction	5,14
31	Distal colon and rectum	Smooth muscle	T 12, L 1, 2, 3	WRC, ST (lumbar splanchnic)	Inferior mesenteric ganglion	Plexus of inferior mesenteric artery	Contraction, inhibition	5,14
32		Blood vessels	T 12, L 1, 2, 3	WRC, ST (lumbar splanchnic)	Inferior mesenteric ganglion	Plexus of inferior mesenteric artery	Vasoconstriction	
33	Internal sphincter ani	Blood vessels and sphincter muscle	L 1, 2, 3	WRC, ST (lumbar splanchnic)	Inferior mesenteric ganglion	Superior hypogastric plexus	Vasoconstriction, contraction	5,14
34	Kidney	Blood vessels and smooth muscle	T 5 - L 2	WRC, ST (thoracic splanchnic)	Aorticorenal or renal ganglion	Renal plexus	Vasomotor changes	5,14
35	Ureter	Blood vessels and smooth muscle	T 5 - L 2	WRC, ST (thoracic and lumbar splanchnic)	Aorticorenal or renal and inferior hypogastric ganglia	Renal plexus and hypogastric nerves	Rhythmic contraction	5,14
36	Bladder	Detrusor vesicae	L 1-3	WRC, ST (hypogastric nerves, inferior hypogastric plexus)	Vesical plexus, intramural ganglia	Intramural plexus	Relaxation	9

38. AUTONOMIC NERVOUS SYSTEM: MAN

Part I. SYMPATHETIC CONNECTIONS

	Organ	Effector	Preganglionic Neurones		Postganglionic Neurones		Actions	Reference
			Cell Body	Pathway	Cell Body	Distribution		
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
37	Bladder	Sphincter vesicae	L 1-3	WRC, ST (hypogastric nerves, inferior hypogastric plexus)	Vesical plexus	Intramural plexus	Constriction for ejaculation	10
38	Urethra	Compressor urethrae	L 1-3	WRC, ST (hypogastric nerves, inferior hypogastric plexus)	Vesical plexus, intramural ganglia	Prostatic plexus	Contraction	5,14
39	Prostate gland	Smooth muscle	T 12 - L 2	WRC, ST (hypogastric nerves, inferior hypogastric plexus)	Vesical and prostatic plexuses	Prostatic plexus	Contraction, ejaculation	5,14
40	Seminal vesicle and vas deferens	Smooth muscle	T 12 - L 2	WRC, ST (hypogastric nerves, inferior hypogastric plexus)	Vesical plexus	Plexuses of seminal vesicles and vasa deferentia	Contraction, ejaculation	5,14
41	Testis	Blood vessels	T 6-12	WRC, ST	Probably lower thoracic ganglia of sympathetic trunk	Thoracic splanchnic nerves → aortic and renal plexuses → spermatic plexus	Vasoconstriction	5,14
42	Corpora cavernosa	Blood vessels	T 12 - L 2	WRC, ST	Lumbar and sacral ganglia of sympathetic trunk	Inferior hypogastric plexus → prostatic plexus → cavernous plexus	Vasoconstriction	5,14
43	Clitoris, labia minora	Blood vessels	T 12 - L 2	WRC, ST	Lumbar and sacral ganglia of sympathetic trunk	Inferior hypogastric plexus → vaginal plexus → cavernous plexus	Vasoconstriction	5,14
44	Vagina	Smooth muscle	T 12 - L 2	WRC, ST (hypogastric nerves)	Inferior hypogastric and uterovaginal plexuses	Vaginal plexus	Contraction	5,14
45	Ovary and uterine tube	Vascular bed and stroma	T 6-12	WRC, ST	Probably lower thoracic ganglia of sympathetic trunk	Thoracic splanchnic nerves → aortic and renal plexuses → ovarian plexus	Vasoconstriction, contraction	5,14

38. AUTONOMIC NERVOUS SYSTEM: MAN

Part II. PARASYMPATHETIC CONNECTIONS

Cell Body (column C): Boldface type indicates cell bodies agreed upon by most investigators.

	Organ	Effector	Preganglionic Neurones		Distribution of Postganglionic Neurones	Actions	Reference
			Cell Body	Pathway			
	(A)	(B)	(C)	(D)	(E)	(F)	(G)
1	Eye	Sphincter pupillae	Accessory (autonomic) oculomotor nucleus	Oculomotor nerve → motor root → ciliary ganglion	Ciliary ganglion → short ciliary nerves	Constriction of pupil	3,7
2		Ciliary muscle	Accessory (autonomic) oculomotor nucleus	Oculomotor nerve → motor root → ciliary ganglion	Ciliary ganglion → short ciliary nerves	Accommodation	12
3	Lacrimal gland	Gland cells	Nucleus salivatorius superior	Nervus intermedius → greater petrosal nerve → nerve of pterygoid canal	Pterygopalatine ganglion → zygomatic nerve → lacrimal nerve	Secretion	12
4	Heart	Sinoatrial node; atrioventricular node, conduction system; cardiac muscle	Dorsal motor nucleus of vagus	Superior, inferior, and thoracic cardiac rami of vagus	Intrinsic cardiac ganglia	Inhibitory; decreases heart rate	5
5	Coronary arteries	Smooth muscle	Dorsal motor nucleus of vagus	Superior, inferior, and thoracic cardiac rami of vagus	Intrinsic cardiac ganglia, adventitia and branches of coronary artery	Constriction	13
6	Blood vessels	Smooth muscle	Demonstrated only for brain, meninges, face, most glands, and pelvic and genital organs			Vasoconstriction	12
7	Suprarenal medulla	None demonstrated					12
8	Spleen	None demonstrated					12
9	Lung and trachea	Smooth muscle of trachea, bronchial tree	Dorsal motor nucleus of vagus	Vagal branches → anterior and posterior pulmonary, and cardiac plexuses	Intramural tracheal and bronchial ganglia	Tracheal and bronchial constriction	12
10		Tracheal and bronchial glands	Dorsal motor nucleus of vagus	Vagal branches → anterior and posterior pulmonary, and cardiac plexuses	Intramural tracheal and bronchial ganglia	Secretion	
11	Submaxillary and sublingual glands	Gland cells and blood vessels	Nucleus salivatorius superior	Nervus intermedius → 7th nerve → chorda tympani → lingual nerve	Submaxillary ganglion → submaxillary and sublingual branches	Secretion, vasodilation	6
12	Parotid gland	Gland cells and blood vessels	Nucleus salivatorius inferior	9th nerve → tympanic nerve → lesser petrosal nerve	Otic ganglion → auriculotemporal nerve	Secretion, vasodilation	12
13	Lower esophagus	Smooth muscle	Dorsal motor nucleus of vagus	Vagus nerve → esophageal plexus	Myenteric ganglionated plexus	Increases tonus; peristalsis	12
14		Cardiac sphincter	Dorsal motor nucleus of vagus	Vagus nerve → esophageal plexus	Myenteric ganglionated plexus	Relaxation	
15	Stomach	Smooth muscle	Dorsal motor nucleus of vagus	Vagus nerve → gastric branches	Myenteric plexus	Contraction; increases tonus; peristalsis	2
16		Gastric glands	Dorsal motor nucleus of vagus	Vagus nerve → gastric branches	Submucosal plexus	Secretion	11
17	Pyloric sphincter	Smooth muscle	Dorsal motor nucleus of vagus	Vagus nerve → pyloric branches	Myenteric plexus	Inhibitory; diminishes tonus	12
18	Pancreas	Gland cells and blood vessels	Dorsal motor nucleus of vagus	Vagus nerve → pancreatic branches	Pancreatic ganglia	Secretion, vasodilation	12

Part II. PARASYMPATHETIC CONNECTIONS

	Organ	Effector	Preganglionic Neurones		Distribution of Postganglionic Neurones	Actions	Reference
			Cell Body	Pathway			
	(A)	(B)	(C)	(D)	(E)	(F)	(G)
19	Liver	Hepatic cells, blood vessels, ducts	Dorsal motor nucleus of vagus	Vagus nerve → hepatic branches	Intramural ganglia	Secretion?	12
20	Gallbladder	Smooth muscle	Dorsal motor nucleus of vagus	Vagus nerve → hepatic and cystic plexuses	Intramural ganglia	Emptying of gallbladder	5
21	Biliary tree	Smooth muscle	Dorsal motor nucleus of vagus	Vagus nerve → hepatic and gastroduodenal plexuses	Intramural ganglia	Elevates pressure of bile ducts	5
22	Sphincter of common bile ducts	Smooth muscle	Dorsal motor nucleus of vagus	Vagus nerve → hepatic and gastroduodenal plexuses	Intramural ganglia	Relaxation	5
23	Small intestine	Smooth muscle	Dorsal motor nucleus of vagus	Vagus nerve → celiac and superior mesenteric branches	Myenteric plexus	Contraction, peristalsis	12
24		Gland	Dorsal motor nucleus of vagus	Vagus nerve → celiac and superior mesenteric branches	Submucosal plexus	Secretion	
25	Ileocecal sphincter	Smooth muscle	Dorsal motor nucleus of vagus	Vagus nerve → celiac and superior mesenteric branches	Myenteric plexus	Inhibitory; diminishes tonus	12
26	Proximal colon	Smooth muscle	Dorsal motor nucleus of vagus	Vagus nerve → celiac and superior mesenteric branches	Myenteric gangliionated plexus	Contraction, peristalsis	12
27		Glands	Dorsal motor nucleus of vagus	Vagus nerve → celiac and superior mesenteric branches	Submucosal gangliionated plexus	Secretion	
28	Distal colon	Smooth muscle	S 2-4	Pelvic splanchnic nerves → hypogastric nerves → inferior mesenteric plexus	Myenteric plexus	Contraction, vasodilation; peristalsis	1
29		Glands	S 2-4	Pelvic splanchnic nerves → hypogastric nerves → inferior mesenteric plexus	Submucosal plexus	Secretion	
30		Internal sphincter ani	S 2-4	Pelvic splanchnic nerves → inferior hypogastric plexus	Myenteric plexus	Inhibition, vasodilation	
31	Kidney	None demonstrated					12
32	Ureter	Smooth muscle	S 2-4	Pelvic splanchnic nerves → hypogastric nerves	Intramural ganglia	Contraction	9
33	Bladder	Detrusor vesicae	S 2, 3, 4	Pelvic splanchnic nerves (nervi erigentes)	Inferior hypogastric plexus → vesical and intramural ganglia	Contraction	8,10
34		Sphincter vesicae	S 2, 3, 4	Pelvic splanchnic nerves (nervi erigentes)	Inferior hypogastric plexus → vesical and intramural ganglia	Relaxation	8
35	Urethra	Smooth muscle	S 2, 3, 4	Pelvic splanchnic nerves	Inferior hypogastric plexus → vesical plexus → prostatic plexus	Control of sphincter	8
36	Prostate gland	Smooth muscle	S 2, 3, 4	Pelvic splanchnic nerves	Inferior hypogastric plexus → vesical plexus → prostatic plexus	?	12
37	Seminal vesicle and vas deferens	Smooth muscle	S 2, 3, 4	Pelvic splanchnic nerves	Inferior hypogastric and vesical plexuses	?	12
38	Testis	None demonstrated					12

Part III. GANGLIA

Division (column B): S = sympathetic; P = parasympathetic.

	Ganglion	Division	Location	Preganglionic Connections	Postganglionic Distribution
	(A)	(B)	(C)	(D)	(E)
1	Aorticorenal	S	Root of renal artery	Thoracic splanchnic nerves	Renal and aortic plexuses
2	Bronchial	P	Bronchial plexuses	Vagus nerves	Bronchial musculature and glands
3	Cardiac	P	Cardiac plexus	Vagus nerves	Heart, coronary vessels, pulmonary plexuses
4	Celiac	S	Celiac plexus	Thoracic splanchnic nerves	Abdominal viscera and blood vessels
	Cervical sympathetic				
5	Inferior	S	Sympathetic trunk, level of vertebra T 1	Upper thoracic nerves	Brachial plexus, inferior cervical cardiac nerve, common carotid plexus, vertebral nerves

38. AUTONOMIC NERVOUS SYSTEM: MAN

Part III. GANGLIA

	Ganglion	Division	Location	Preganglionic Connections	Postganglionic Distribution
	(A)	(B)	(C)	(D)	(E)
	Cervical sympathetic				
6	Middle	S	Sympathetic trunk, level of vertebra C 6	Upper thoracic nerves	Middle cervical cardiac nerve, sympathetic roots of nerves C 5, 6
7	Superior	S	Sympathetic trunk opposite 2nd, 3rd, 4th cervical vertebrae	Upper thoracic nerves	Internal, external carotid nerves, sympathetic roots of nerves C 1-3, superior cervical cardiac nerves
8	Cervical of uterus	P,S	Inferior hypogastric plexus adjacent to cervix of uterus	Pelvic splanchnic nerves, inferior hypogastric plexus	Uterus and vagina
9	Ciliary	P	Orbit, between optic nerve and lateral rectus muscle	Oculomotor	Short ciliary nerves
10	Enteric	P	Wall of enteric canal	Vagus and pelvic splanchnic nerves	Enteric muscles and glands
11	Impar (coccygeal)	S	Ventral surface of coccyx	Lumbar spinal nerves	Caudal spinal nerves
12	Intermediate	S	In relation to ventral nerve roots and communicating rami	Ventral nerve roots	Primary ventral rami of spinal nerves, visceral nerves
13	Lingual	P	Tongue	Facial and chorda tympani	Lingual glands
	Mesenteric				
14	Inferior	S	Adjacent to inferior mesenteric artery	Lumbar splanchnic nerves	Inferior mesenteric and superior hypogastric plexuses
15	Superior	S	Adjacent to root of superior mesenteric artery	Thoracic splanchnic nerves	Superior mesenteric, aortic, and renal plexuses
16	Myenteric	P	Between longitudinal and circular enteric muscle layers	Vagus and pelvic splanchnic nerves	Enteric muscles
17	Otic	P	Medial to mandibular nerve, just below foramen ovale	Glossopharyngeal nerve	Supplies auriculotemporal nerve with fibers to parotid gland
18	Pelvic	P,S	Adjacent to pelvic viscera	Pelvic splanchnic nerves, inferior hypogastric plexus	Pelvic viscera and blood vessels, and vessels in external genitalia
19	Pterygopalatine[1]	P	Pterygopalatine fossa	Facial nerve	Pharyngeal, palatine, nasal, and orbital nerves
20	Pulmonary	P	Pulmonary plexuses	Vagus nerves	Bronchial plexuses
21	Splanchnic	S	Posterior mediastinum in relation to thoracic splanchnic nerves	Thoracic splanchnic nerves	Celiac plexus
22	Submandibular	P	Between lingual nerve and duct of submandibular gland	Chorda tympani (through facial)	Submandibular, sublingual, and lingual glands
23	Submucous	P	Submucosa of enteric canal	Vagus and pelvic splanchnic nerves	Enteric muscles and glands
24	Sympathetic trunk	S	Ventrolateral to vertebral column	Spinal nerves T 1 - L 2	Sympathetic roots of spinal nerves, cephalic sympathetic, cardiac and splanchnic nerves
25	Terminale	P	Adjacent to olfactory tract	Nervus terminalis	Anterior cerebral artery, vomeronasal organ, nasal mucosa
26	Tracheal	P	Tracheal wall	Vagus nerves	Tracheal and bronchial plexuses
27	Vertebral	S	Sympathetic trunk, level of vertebra C 8	Upper thoracic nerves	Ansa subclavia, inferior cervical cardiac nerve, vertebral nerves, sympathetic roots of nerves C 6, 7, 8

/1/ Supplied by greater petrosal through facial nerve.

Part IV. PLEXUSES

Division (column B): S = sympathetic; P = parasympathetic.

	Plexus	Division	Origin	Distribution
	(A)	(B)	(C)	(D)
1	Aortic	S	Sympathetic trunks	Aorta and proximal portions of its branches
	Cardiac			
2	Superficial	P,S	Cervical and thoracic sympathetic cardiac nerves, branches of vagus nerves	Heart, coronary vessels, anterior pulmonary plexuses
3	Deep	P,S	Right superior, middle and inferior cervical and thoracic sympathetic cardiac nerves; all cardiac branches of right vagus, left middle and inferior cervical and thoracic cardiac nerves, superior cervical and cardiac branches of left vagus	Heart, coronary vessels, anterior pulmonary plexuses
	Carotid			
4	Common	S	Sympathetic trunk	Common carotid artery
5	External	S	Superior cervical ganglion, common and external carotid plexuses	External carotid artery and its branches
6	Internal	S	Superior cervical ganglion, common and internal carotid plexuses	Internal carotid artery and its branches, caroticotympanic and deep petrosal nerves, cavernous plexus
7	Cavernous	S	Internal carotid plexus	Cavernous sinus, oculomotor, trochlear and ophthalmic nerves, ciliary ganglion, hypophysis cerebri
8	Celiac	S	Intrinsic ganglia, splanchnic nerves	Celiac artery and its branches
9	Colic	S	Inferior mesenteric plexus	Colon and rectum
10	Duodenal	S	Gastroduodenal, superior mesenteric, and pancreatic plexuses	Duodenum and pancreas
11	Enteric	P	Vagus, pelvic splanchnic nerves, intrinsic ganglia; esophageal, celiac, mesenteric, and pelvic plexuses	Enteric canal
12	External carotid	S	External carotid plexus	External carotid artery, submandibular and otic ganglia
13	Hepatic	P,S	Vagus nerves and celiac plexus	Biliary system, hepatic blood vessels
14	Hypogastric	S	Celiac, aortic, inferior mesenteric plexuses	Inferior hypogastric plexus
15	Spermatic	S	Aortic and renal plexuses	Spermatic artery, spermatic cord, testis
	Mesenteric			
16	Inferior	S	Celiac plexus, lumbar splanchnic nerves	Inferior mesenteric artery and its branches
17	Superior	S	Celiac plexus	Superior mesenteric artery and its branches
18	Meningeal, middle	S	External carotid plexus	Middle meningeal artery
19	Ovarian	S	Aortic and renal plexuses	Ovarian artery, ovary
20	Pancreatic	P,S	Vagus nerves, intrinsic ganglia, sympathetic trunks	Pancreas, pancreatic ducts and vessels
21	Pelvic	P,S	Inferior hypogastric plexus, pelvic splanchnic nerves, intrinsic ganglia	Pelvic viscera and blood vessels, and vessels of erectile tissue
22	Pulmonary	P,S	Vagus nerves, intrinsic ganglia, sympathetic trunks	Bronchial plexuses, pulmonary vessels
23	Phrenic	S	Celiac plexus, lesser and least splanchnic nerves	Renal blood vessels; supplies suprarenal gland, diaphragm, esophagus, inferior vena cava
24	Prostatic	P,S	Inferior hypogastric plexus	Prostate gland
25	Renal	S	Celiac plexus, thoracic splanchnic nerves	Renal blood vessels
26	Sigmoid	S	Inferior mesenteric plexus	Sigmoid colon
27	Splenic	S	Celiac plexus	Spleen, pancreas, stomach
28	Suprarenal	S	Celiac plexus	Suprarenal artery and gland
29	Tympanic	P,S	Internal carotid nerve, ramus from geniculate ganglion	Tympanum, mastoid cells, auditory tube
30	Uterine	P,S	Inferior hypogastric plexus	Uterus
31	Vaginal	P,S	Inferior hypogastric plexus	Vagina
32	Vesical	P,S	Inferior hypogastric plexus	Urinary bladder

Part I.

For a comprehensive review of the

	Component	Mammalia: *Homo sapiens*	*Bos taurus*	*Canis familiaris*	Aves
	(A)	(B)	(C)	(D)	(E)
1	Sinus venosus	Sinus venosus completely incorporated into right atrium[3]. Sinoatrial node same as in *Bos* and *Canis*.	Incorporated into right atrium. Sinoatrial node, or "pacemaker," is specialized tissue in atrial region (was part of sinus in embryo).		Largely included in right atrium.
2	Sinoatrial junction	Vestige of embryonic sinoatrial junction found in adult right atrium.	Right valve of embryonic sinus becomes valve of inferior vena cava and of coronary sinus.		Embryonic right sinal valve becomes valve of inferior vena cava.
3	Atrium	Complete interatrial septum except for small remnant of foramen ovale. Sinoatrial and atrioventricular nodes connected by typical cardiac fibers of right atrium.	Complete interatrial septum. Histological characteristics of sinoatrial and atrioventricular nodal fibers unusually clear.	Complete interatrial septum. Sinoatrial node near opening of superior vena cava, atrioventricular node near opening of coronary sinus.	Complete interatrial septum. Extensive distribution of specialized conduction fibers.
4	Atrioventricular junction	Atrioventricular ring of dense connective tissue. Right atrioventricular valve is tricuspid, left valve is bicuspid. Atrioventricular bundle of His present from atrioventricular node to ventricles. In the adult, usually no muscular atrioventricular connections other than the bundle of His [9].	Connective tissue of atrioventricular ring (annulus fibrosus) contains bone. Atrioventricular bundle is usually distinct. Right atrioventricular valve usually tricuspid, left valve usually bicuspid.	Atrioventricular valves the same as in *Bos*. Ring of connective tissue separates atrial and ventricular muscle, except for atrioventricular bundle of His.	Atrial and ventricular muscles separated by ring of connective tissue, except for atrioventricular bundles. Right atrioventricular valve is large and muscular, left valve is bicuspid.
5	Ventricle	Complete interventricular septum, membranous in uppermost reaches.	Complete septum. Histological characteristics of Purkinje (conduction) fibers distinct.	Complete ventricular septum.	Complete ventricular septum.
6	Conus arteriosus	Proximal portion incorporated in right ventricle, distal incorporated in left aortic and pulmonary trunks.			Proximal portion incorporated in right ventricle, distal incorporated in right aortic and pulmonary trunks.
7	Truncus arteriosus[6]	Divided into aortic and pulmonary trunks. Semilunar valves at embryonic juncture of conus and truncus.			

/1/ Data for Crocodylia from White [13]. /2/ Data from Favaro [3]. /3/ Some authorities are of the opinion that a are present in the turtle and in lower forms is supported by Robb [12], while the view that a specialized conduction expanded portion of the ventral aorta lying within the pericardial cavity; also known as the bulbus arteriosus, or

subject, consult references 4, 8, 10.

Reptilia[1]	Amphibia	Pisces and Chondrichthyes	Agnatha[3]	
(F)	(G)	(H)	(I)	
Partly incorporated into right atrium, and is distinct only internally. Chelonia: Origin of beat is dependent on intrinsic ganglia [6].	Salientia: Separate chamber and relatively smaller than in Caudata. Caudata: Thin-walled, triangular-shaped chamber, shifted toward right side.	Smooth, thin-walled chamber into which systemic veins open. Cardiac muscle has high intrinsic contraction rate and acts as the "pacemaker" (although contraction is myogenic in origin, rate of beat is under nervous control, being depressed by vagal stimulation and accelerated by sympathetic stimulation).	Thin-walled, elongated sac or tube into which systemic veins open.	1
Approximately the same as in Pisces.		Sinoatrial opening guarded by pair of valves. Cardiac muscle continuous from sinus to atrium.	Sinoatrial opening guarded by pair of valves.	2
Same as in Salientia, but interatrial septum contributes to valves dividing atrioventricular opening in two.	Salientia: Complete interatrial septum. Caudata: Incomplete septum partially dividing chamber bilaterally, with sinus venosus opening into right atrium and single pulmonary vein into left atrium.	Thin, reticulate-walled chamber; no division into right and left sides, no pulmonary veins. Dipnoi: Partial septation. Pulmonary vein enters to left and sinus venosus to right of septum.	Single muscular sac. Atrium lateral to ventricle.	3
Crocodylia: Atrioventricular ring contains cartilage extending into base of right atrioventricular valve and similar valve of right aortic arch. Chelonia: Continuity of muscle, as in teleosts. Presence of "Purkinje-like" fibers controversial.[4]	Continuity of atrial and ventricular muscles, as in Pisces. Salientia: Four valve cusps. Caudata: Atrioventricular valve of two or four muscular thickenings.	Atrioventricular valve composed of two cusps. Cardiac muscle of atrium continuous with that of ventricle around entire circumference of atrioventricular junction. Dipnoi: Fibrocartilaginous plug regulates blood flow.	Atrioventricular channel connects both vesicles. Two valves present.	4
Serpentes, Sauria, Chelonia: Ventricle partially divided by incomplete septum. Crocodylia: Complete ventricular septum containing cartilage.	No ventricular septum.	Thick-walled chamber; network of muscular trabeculae; no division into right and left sides. Dipnoi: Septum present.	Thick-walled muscular sac with smooth internal surface.	5
Conus incorporated in ventricle and in arterial trunks.	Semilunar valves; also a "spiral valve" coursing lengthwise.	Semilunar valves present. Pisces: Small. Dipnoi: Divided into dorsal and ventral channels. Chondrichthyes: Relatively large.	Absent, unless two valves may be regarded as remnants.	6
Crocodylia: Right and left systemics connected by foramen of Panizza. Chelonia: Divided into right and left systemic and pulmonary trunks.	Salientia: Divided both internally and externally into right and left channels. Caudata: Divided internally into right and left channels.	Pisces: Enlarged in species having reduced conus in shape of bulbus arteriosus. Dipnoi: Divided into three paired channels.	Part bordering on ventricle enlarged to form bulbus arteriosus.	7

small part of the sinus venosus is also incorporated in the left atrium [5]. /4/ The view that "Purkinje-like" fibers system of Purkinje fibers is neomorphic for birds and mammals is supported by Davies and Francis [2]. /5/ An aortic sac [1, 7, 11].

Part II. BLOOD

	Vessel (A)	Mammalia (B)	Aves (C)	Reptilia (D)
	Main Longitudinal Vessels			
1	Aorta and caudal artery	Continuous vessels located ventral to the axial skeleton, extending from the region of the heart to the tip of the tail. Caudal artery enclosed in the hemal channel.		
2	Aortic arches	Left aortic arch only.	Right aortic arch only.	One pair of aortic arches.
3	Carotid arteries	Various connections of internal and external carotids with aortic arch: innominate artery, common carotid artery, carotid trunk.	Internal and external carotids originate from common carotid arteries, which may be symmetrical, asymmettical, fused, or one may be obliterated.	Internal and external carotid arteries originate from common carotids. Many Serpentes: Only one common carotid. Crocodylia: Carotid duct absent.
4	Posterior cardinal veins	In all embryos, two posterior cardinal veins are present, being continuous with the caudal vein. No renal portal system. Posterior cardinals obliterated and replaced by supracardinal derivatives, the azygos and hemiazygos veins. Posterior vena cava is main trunk vein.	Rudimentary caudal and renal portal veins. Renal veins join femoral and internal iliac veins in kidney, which in turn join to form posterior vena cava. Posterior vena cava receives hepatic vein; no posterior cardinal veins persist.	Formation of kidneys causes great changes in distribution of posterior cardinals (renal portal system). Sauria: Caudal vein empties into two renal portal veins. Two hepatic veins join posterior vena cava. Crocodylia: Posterior vena cava emerges as single vessel from kidneys.
5	Anterior cardinal veins	Two anterior venae cavae, each consisting of an anterior cardinal vein, inferior jugular vein, and subclavian vein. Primates, Carnivora: Section of left vein, located between heart and anastomosis, disappears. Ungulata: Right vena cava more prominent than left because blood passes from left into right by anastomosis. Rodentia, Insectivora: Innominate veins of equal size.	Two anterior venae cavae, each consisting of an anterior cardinal vein, vertebral vein, and subclavian vein. Right cardinal vein more prominent than left. Inferior jugular vein absent.	Sauria: Similar in structure to *Sphenodon*. *Sphenodon:* Two anterior cardinal veins (internal jugular veins). Inferior jugular veins (external) reduced and replaced by tracheal vein; these veins join subclavian vein to form anterior vena cava.
	Main Segmental Vessels[1]			
6	Dorsal segmental vessels	In each myoseptum, one artery and one vein are present. Tributaries are ventral medullary arteries and veins, and muscular arteries and veins.		Serpentes: Longitudinal dorsal vein present.
7	Dorsal rami			
8	Ventral rami	Segmental vessels run from the main longitudinal vessels (aorta, cardinal veins) in horizontal myoseptum and reach skin. Tributaries are muscular arteries and veins. Some segmental become intercostal arteries and veins that surpass main vessels in size. In region of paired limbs, segmental vessels become subclavian and iliac arteries and veins.		

/1/ In all embryos, dorsal, lateral, and ventral segmental arteries and veins are present. They persist at least

VESSELS

Amphibia (E)	Pisces and Chondrichthyes (F)	Agnatha (G)	
Main Longitudinal Vessels			
Continuous vessels located ventral to the axial skeleton, extending from the region of the heart to the tip of the tail. Caudal artery enclosed in the hemal channel; aorta similarly enclosed in *Acipenser* (sturgeon) only.			1
One to four pair of aortic arches.	Mainly four to five epibranchial arteries. Dipnoi: Pulmonary arteries present.	Six, seven, or more epibranchial arteries.	2
Internal and external carotid arteries. Salientia: Carotid duct absent.	Internal carotid arteries.	Petromyzones: Internal carotid artery dorsal, external carotid artery ventral. Myxini: Internal and external carotid arteries.	3
In all embryos, two posterior cardinal veins are present, being continuous with the caudal vein.			4
Formation of kidneys causes great changes in distribution of posterior cardinals (renal portal system).		Renal portal system absent. Petromyzones: Same as in embryo. Myxini: Same as in embryo, but right posterior cardinal vein much thinner than left.	
Posterior cardinals rudimentary. Well-developed posterior vena cava drains kidneys. Caudata: Renal portal blood derived from iliac and caudal veins.	Pisces: Posterior cardinals often asymmetrical but receive renal and hepatic veins. Renal portal blood derived from caudal vein and/or segmental veins; caudal vein often leads directly to posterior cardinal. Dipnoi: Caudal vein, renal portal veins, asymmetric posterior cardinal vein, and a posterior vena cava. Chondrichthyes: Caudal vein empties into renal portal veins; hepatic veins empty into posterior cardinal veins, which are sinus-like distentions.		
Salientia: Anterior cardinal veins (internal jugulars) and inferior jugular veins fuse into one short trunk on each side and enter sinus venosus by intermediation of anterior vena cava (cranial). Caudata: Two anterior cardinal veins (internal jugulars), two inferior jugular veins.	Pisces: Two cardinal veins. Mainly one internal jugular vein joining sinus venosus. Dipnoi: Two cardinal and two jugular veins. Chondrichthyes: Anterior cardinal veins (internal jugulars) are sinus-like distentions. Inferior jugular veins open into duct of Cuvier.	Petromyzones: Anterior cardinal veins unite to form common trunk and open into sinus venosus. Inferior jugular vein (ventral) present. Myxini: Left anterior cardinal vein (internal jugular) and inferior jugular vein (ventral) join sinus venosus. Right anterior cardinal vein opens into cor portale of liver.	5
Main Segmental Vessels[1]			
Arteries and veins alternate in successive segments; their dorsal tips join to form the longitudinal dorsal trunk, and may persist in adults. Tributaries of dorsal segmental vessels are ventral medullary arteries and veins, and muscular arteries and veins.			6
	Deep pinnal arteries and veins are segmental vessels, supplying dorsal fins.		7
Segmental vessels run from the main longitudinal vessels (aorta, cardinal veins) in horizontal myoseptum and reach skin. Tributaries are muscular arteries and veins. Some segmental become intercostal arteries and veins that surpass main vessels in size. In region of paired fins and limbs, segmental vessels become subclavian and iliac arteries and veins.			8

partially in adults and give rise to some longitudinal as well as other important stems.

continued

	Vessel	Mammalia	Aves	Reptilia
	(A)	(B)	(C)	(D)
	Main Segmental Vessels[1]			
	Dorsal segmental vessels			
9	Lateral cutaneous vein[2]			Sauria: Lateral cutaneous vein probably present in all species.
10	Abdominal vein[2]	Only anterior root of abdominal vein persists and is represented by umbilical vein in the embryo.		Abdominal vein, double or single, connects renal portal with hepatic portal system.
11	Epigastric arteries and veins[2]	Two distinct trunks running close to each other are located on the inner surface of the abdominal wall between longitudinal abdominal and segmental trunk muscles. Probably absent in birds.		
12	Lateral segmental vessels	Paired lateral vessels supply pronephros, mesonephros, and, when present, metanephros. Their number is much reduced in higher forms when forming renal and gonadal arteries.		
13	Ventral segmental vessels	In all embryos, ventral segmental vessels originate from main longitudinal vessels (aorta, caudal artery, caudal vein). In trunk, only arteries (mesenteric) originate from main longitudinal vessels, and in tail both arteries and veins. Paired arteries frequently unite to form a single median vessel.		
14	Arteries	Celiac artery, anterior mesenteric artery (cranial or superior), posterior mesenteric artery (caudal or inferior).	Celiac artery, anterior mesenteric artery (superior), posterior mesenteric artery (inferior).	Serpentes: Many arteries (mesenteric) reach intestine from the aorta *(Boa)*. Sauria: Gastric, celiomesenteric, and posterior mesenteric arteries. Crocodylia: Gastroesophageal, celiomesenteric, and mesenteric arteries. *Sphenodon:* Gastric, celiac, common mesenteric (anterior), and posterior mesenteric arteries.
15	Veins	Subintestinal vein, which gets some blood directly from caudal vein, develops with invasion of intestine by ventral segmental arteries. Subintestinal vein is prominent vessel in embryonic fish and amphibians; less significant in birds and reptiles; remnants found in *Didelphis;* parallels ventral border of intestinal tube and enters right omphalomesenteric vein. Subintestinal and parts of right and left omphalomesenteric veins form the hepatic portal vein. Omphalomesenteric veins and umbilical vein participate in liver circulation; hepatic vein opens into posterior vena cava; subintestinal vein is incorporated into trunk of hepatic portal vein.		
	Vessels of the Forelimb			
16	Arteries	Right subclavian artery arises from left aortic arch, chiefly as innominate artery, and left subclavian directly from arch or truncus communis. Axillary artery, brachial artery, median artery (main vessel in most mammals), ulnar artery (main vessel in Prosimii), radial artery, interosseal artery (main vessel in *Ornithorhynchus)*. Metacarpal arteries, dorsal and volar digital arteries.	Subclavian artery, with carotid artery, originates from right aortic arch (innominate artery). Axillary, brachial, ulnar (main vessel), interosseal, radial, and ulnar nerve arteries; metacarpal and digital arteries.	Sauria: Both subclavian arteries arise from right aortic arch. Axillary, brachial, interosseal (main vessel), ulnar, radial, and median arteries; metacarpal and digital arteries. Chelonia: Subclavian artery, with carotid artery, originates from innominate artery. Brachial artery replaced by lateral brachial artery. Two arterial arches of hand, dorsal and volar.

/1/ In all embryos, dorsal, lateral, and ventral segmental arteries and veins are present. They persist at least originating from ventral rami of dorsal segmental vessels.

VESSELS

Amphibia	Pisces and Chondrichthyes	Agnatha	
(E)	(F)	(G)	
Main Segmental Vessels[1]			
Gymnophiona, Caudata, Dipnoi, Chondrichthyes: Lateral cutaneous vein in lateral line groove, below skin from tail to region of forelimb. Originates from end tips of lateral segmental veins. Salientia: Great and small cutaneous vein.			9
Extends from region of cloaca to shoulder girdle, where it merges into sinus venosus or into hepatic portal system. Salientia, Caudata: A single median, ventral abdominal vein.	Chondrichthyes: Two lateral abdominal veins, one on each side of body wall.		10
Two distinct trunks running close to each other are located on the inner surface of the abdominal wall between longitudinal abdominal and segmental trunk muscles.		Myxini: Netlike track.	11
Paired lateral vessels supply pronephros and mesonephros.			12
In all embryos, ventral segmental vessels originate from main longitudinal vessels (aorta, caudal artery, caudal vein). In trunk, only arteries (mesenteric) originate from main longitudinal vessels, and in tail both arteries and veins. Paired arteries frequently unite to form a single median vessel.			13
Salientia: Only celiomesenteric artery. Caudata: Celiac artery and about 13 mesenteric arteries, almost segmental in arrangement, distributed to intestine *(Siren)*. Segmental arteries fuse into complex vessels *(Menobranchus, Cryptobranchus, Salamandra)*.	Pisces: Mainly one celiomesenteric artery. Dipnoi: Celiac artery, two or three mesenteric arteries. Chondrichthyes: Celiac artery, two or three mesenteric arteries.	Petromyzones: Only one artery persists as celiomesenteric artery. Myxini: Mesenteric arteries (approximately 35 in number) distributed to intestine as segmental vessels.	14
Subintestinal vein, which gets some blood directly from caudal vein, develops with invasion of intestine by ventral segmental arteries. Subintestinal vein is prominent vessel in embryonic fish and amphibians; parallels ventral border of intestinal tube and enters right omphalomesenteric vein. Subintestinal and parts of right and left omphalomesenteric veins form the hepatic portal vein; vitelline vein (omphalomesenteric) may participate in liver circulation.			15
Hepatic vein opens into posterior vena cava. Subintestinal vein is incorporated in trunk of hepatic portal vein.	Hepatic vein opens directly into heart. Many Pisces (including Dipnoi), Chondrichthyes: Subintestinal vein well-developed. Absent in many Cyprinoidea.	Petromyzones: Subintestinal vein well-developed. Myxini: Subintestinal vein reduced.	
Vessels of the Forelimb			
Salientia: Subclavian arteries originate from aortic arch, brachial, and deep brachial arteries. Other vessels same as in Caudata. Caudata: Subclavian artery arises from median aorta. Brachial, interosseal (main vessel), radial (radiomarginal), and ulnar (ulnomarginal) arteries. Dorsal arterial arch of hand, metacarpal and digital arteries.	Pisces: Subclavian artery originates from median aorta. Basal arteries, interradial arteries. Chondrichthyes: Subclavian artery arises from median aorta. Lateral and medial pterygial artery, adradial arteries.	Forelimbs absent.	16

partially in adults and give rise to some longitudinal as well as other important stems. /2/ Longitudinal vessels

17	Veins	Comparative anatomy of these veins awaits revision: digital veins, metacarpal veins, volar and dorsal venous arch, basilic vein (ulnomarginal), cephalic vein (radiomarginal), ulnar vein, radial vein, medial vein, brachial vein, axillary vein, subclavian vein. (The above list valid for five-fingered appendage.)	Metacarpal veins; basilic vein (main vessel), ulnar vein, interosseal vein, radial vein (radiomarginal), brachial vein. Subclavian vein enters anterior vena cava.	Sauria: Digital veins, dorsal venous arch of hand, radial vein (main vessel, marginal radial vein in embryos), ulnar vein, interosseal vein, brachial vein and lateral brachial vein. Lateral cutaneous vein empties into axillary vein. Subclavian vein enters internal jugular vein. *Alligator, Emys:* Only one brachial vein.

	Component	Mammalia	Aves	Reptilia
	(A)	(B)	(C)	(D)
1	Lymph hearts	Absent even in embryos.	In all embryos only one pair of posterior hearts, located in region between pelvis and femur. Hearts persist in some adults *(Alca, Anser, Casuaris, Podiceps, Struthio)*.	Only posterior hearts. Serpentes: Two elongated vesicles, each surrounded by bifurcated transverse processes of four-to-five caudal vertebrae. Sauria: Two ovoid vesicles attached to both ends of transverse process of first caudal vertebra. Crocodylia, Chelonia: Spherical in shape.
2	Lymph sacs (other than hearts), lymph sinuses	Jugular and iliac lymph sacs in embryos only.		Serpentes: Mandibular sinus. Sauria: Retrocardial, axillary, jugular, tracheal, and thyroidal sinuses. Crocodylia: Absent. Chelonia: Jugular cistern.
3	Lymph nodes	Many lymph nodes: approximately 465 in man, 300 in cattle, 60 in dog, 8,000 in horse.	Microscopically discernible nodes in walls of lymph vessels. Anseriformes: Two cervicothoracic and two lumbar lymph glands macroscopically visible.	Chelonia: Small nodes in lower eyelid.

/1/ Cole [7] and Favaro [8] regard these sacs as venous hearts.

CIRCULATORY SYSTEM: VERTEBRATES

VESSELS

Amphibia (E)	Pisces and Chondrichthyes (F)	Agnatha (G)	
Vessels of the Forelimb			
Salientia: Digital veins, dorsal venous arch of hand, ulnar vein (ulnomarginal), radial vein (radiomarginal), interosseal vein. Brachial vein and great cutaneous vein unite to join subclavian vein which enters anterior vena cava (cranial). Deep brachial vein continues as subscapular vein which, together with internal jugular vein, forms brachiocephalic vein. Caudata: Digital veins, interosseal vein (main vessel), ulnar vein (ulnomarginal), radial vein (radiomarginal), brachial vein. Subclavian vein, together with lateral cutaneous vein, enters sinus venosus.	Pisces: Interradial veins, basal vein. Subclavian vein enters duct of Cuvier or posterior cardinal vein. Left subclavian joins abdominal vein and epigastric vein, right subclavian joins only epigastric vein *(Salmo)*. Chondrichthyes: Adradial veins, lateral and medial pterygial vein. Subclavian vein fuses with epigastric vein and enters duct of Cuvier.	Forelimbs absent.	17

LYMPHATICS

Amphibia (E)	Pisces and Chondrichthyes (F)	Agnatha (G)	
Gymnophiona: Approximately 100 spherical vesicles in trunk and tail, beneath skin in lateral line groove. Salientia: One pair of anterior and one-to-four pair of posterior hearts. Caudata: Ten to twenty rounded vesicles on each side of trunk, located as in Gymnophiona.	Pisces: Two elongated vesicles joined by a channel and located at base of tail. Vesicles not pulsating in ganoid fishes. Chondrichthyes: Absent.	Petromyzones: Absent. Myxini: One pair of pulsating sacs located in tail[1].	1
Salientia: In tadpoles, mandibular, circumoral, pericardial, and temporal sinuses; in adults, several subcutaneous sacs. Caudata: Orbital sinus, sinus lymphaticus cordis, axillary sinus in larvae only.	Pisces: Pectoral pinneal, orbital, cephalic, occipital, and lateral sinuses. Chondrichthyes: Absent.	Petromyzones: Supralabial, orbital, ocular ring, and deep labial sinuses. Myxini: Three subcutaneous sacs underlie entire skin.	2

	(A)	(B)	(C)	(D)
4	Subvertebral lymphatic trunks (thoracic duct)	One or two trunks associated with aorta and caudal artery.	Two trunks located on both sides of aorta.	Serpentes, Sauria: Sinus surrounds aorta. Crocodylia: Two slender trunks. Chelonia: Two trunks in tail, single in body cavity and bifurcated anteriorly.
5	Cisterna chyli in lumbar area	Always present. Great variation in shape and size.		Serpentes, Crocodylia: Absent. Sauria, Chelonia: Present.
6	Connections with veins	In most mammals thoracic duct connects with left anterior cardinal vein, in some with right, in few with both.	With anterior cardinal veins.	With anterior cardinal veins.
7	Jugular lymphatic trunk	Irregular lymph vessels join anterior cardinal veins separately or by way of subvertebral trunks.	Each of two trunks joins corresponding subvertebral trunk.	Sauria: Two trunks connected with subvertebral trunks by way of jugular sinus. Crocodylia: Two trunks enter corresponding anterior cardinal veins. Chelonia: Two trunks enter jugular cistern which connects both subvertebral trunks.
8	Lateral longitudinal lymphatic trunks	In adult, present only in tail. In embryos, transitory thoracic part observed.		Serpentes: Lateral trunk reaches maxillary sinus. Sauria: From tip of tail to forelimb. Caudal part enters lymph heart, thoracic part enters axillary sinus. Crocodylia: Only caudal part present. Chelonia: Thoracic part well-developed.
9	Longitudinal lymphatic trunks (other than lateral)

Amphibia	Pisces and Chondrichthyes	Agnatha	
(E)	(F)	(G)	
Gymnophiona: One sinus-like extended trunk accompanies aorta. Salientia: Two trunks. Caudata: One or two trunks.	Two slender trunks located on both sides of aorta and caudal artery.	Petromyzones: Unpaired sinus-like trunk beneath aorta and cardinal veins. Myxini: Two wide trunks located on both sides of aorta; fused into wide sinus in liver region.	4
Gymnophiona, Salientia: Absent. Caudata: Present. Extends to thoracic region.			5
Salientia: With anterior lymph hearts. Caudata: With anterior cardinal veins.	Pisces: With anterior cardinal veins. Chondrichthyes: With posterior cardinal vein at point where subclavian artery crosses.	Petromyzones: Numerous connections with both posterior cardinal veins. Myxini: With anterior cardinal vein.	6
Salientia: Two short trunks connecting head sinuses with anterior lymph hearts. Caudata: Two trunks connected with corresponding subvertebral trunks.	Pisces: Two sinus-like distended vessels connected with corresponding subvertebral trunks. Chondrichthyes: Two trunks connected with corresponding anterior cardinal veins.	Petromyzones: Seven peribranchial sinuses, each connected with anterior cardinal vein. Myxini: Absent.	7
Gymnophiona, Caudata: In lateral line groove from base of tail to head. Opens into lymph hearts. Salientia: In tadpoles: from base of tail to anterior lymph heart, disappearing during metamorphosis.	Pisces: Below skin in lateral line groove from base of tail fin to head; opens into some of head sinuses or directly into duct of Cuvier. Chondrichthyes: Absent.		8
Salientia: Dorsal and ventral trunks only in fin of tadpoles. Caudata: Dorsal trunk unpaired, located in dorsal midline of tail and body. Ventral trunk unpaired, located in ventral midline of tail. Abdominal trunk paired in wall of abdomen.	Pisces: Dorsal trunk unpaired, located in dorsal midline of tail and body, from base of tail fin to head; ventral trunk unpaired, located in ventral midline of tail and in middle of abdominal wall. Spinal trunk dorsal to spinal cord. Chondrichthyes: Absent.		9

	Gland or Tissue	Mammalia	Aves	Reptilia	Amphibia
	(A)	(B)	(C)	(D)	(E)
	Hypophysis Adenohypophysis				
1	Pars distalis	Situated anteriorly and ventrally ("anterior lobe" of older terminology) [18,20].	Large. Situated ventrally or anteroventrally to neurohypophysis. Histologically distinguishable into cephalic and caudal regions. [40]	Well-developed. Situated ventrally and often posteriorly. [40]	Situated at posterior end of gland [32].
2	Pars intermedia	Between pars distalis and neural lobe. Often separated from pars distalis by remains of hypophyseal cleft. Occasionally absent. [18,20]	Absent.	Variable in development, usually with hypophyseal cleft separating it from pars distalis [40].	Situated anterodorsally to pars distalis [32].
3	Pars tuberalis	Surrounds infundibular stem, forming bed for primary plexus of hypophyseal portal system which vascularizes pars distalis [18, 20].	Consists of (i) pars tuberalis proper, a layer of cells on the ventral surface of the diencephalon and within the pia mater; (ii) a portal zone of cell cords and blood vessels, connecting pars tuberalis proper with (iii) pars tuberalis interna which is fused with the pars distalis. [40]	Reduced or absent [40]. Serpentes: Absent [40]. Sauria: Distinguishable only as a few cells in floor of brain [40].	Salientia: Usually reduced (perhaps sometimes absent). Forms two small plates on ventral surface of tuber cinereum. [32] Caudata: Represented by lateral lobes connected with pars distalis [32].
4	Neurohypophysis	Divisible into two regions, pars nervosa and median eminence, each with separate vascularization. Pars nervosa usually globular; formed from distal extremity of infundibulum; may or may not contain an extension of the third ventricle. Median eminence is an ill-defined region of infundibular stalk on floor of diencephalon, usually anterior to pars nervosa and always connected to pars distalis by portal blood vessels. Both parts of neurohypophysis contain endings of neurosecretory neurones from the hypothalamus. [18,40]	Distinct neural lobe, or pars nervosa, lying posteriorly and carried by an infundibular stem. A median eminence develops from floor of third ventricle, or infundibular stem anterior to pars nervosa, from which it is not sharply delimited; covered by capillary net of hypophyseal portal system. [40]	Well-defined neural lobe [40]. Serpentes: Compact organ [40]. *Sphenodon*, some Sauria, Chelonia: Thin-walled sac [40]. A median eminence is differentiated out of infundibular floor. Ranges from a simple form, differing little from neural lobe, to a thickened structure with capillaries of the hypophyseal portal system buried in it. [18,40]	A true neural lobe, or pars nervosa, with independent blood supply, is present as a posterodorsal thickening of the infundibular process. Relatively large in terrestrial species, smaller in more aquatic ones. [18] *Rana:* A median eminence with portal vessels [18].

ENDOCRINE SYSTEM: VERTEBRATES

Pisces		Chondrichthyes	Agnatha		
Crossopterygii	Neopterygii and Palaeopterygii		Myxini	Petromyzones	
(F)	(G)	(H)	(I)	(J)	
Protopterus: Situated ventrally. Separated from pars intermedia by large hypophyseal cleft. [41] *Latimeria:* has form of elongated cord [30].	Probably represented by rostral zone and proximal zone of pars distalis. Rostral zone is follicular in lower forms such as *Acipenser, Amia,* and *Lepisosteus.* [32,33] *Polypterus:* Hypophyseal duct remains open in adult [32,33].	Probably represented by tonguelike rostral lobe; also by a ventral lobe, variable in shape and size, which is peculiar to the group. [10,33]	Rostral zone (irregular cell cords), histologically differentiated from proximal zone (broad cell cords). Both separated from brain by layer of connective tissue. [31,38]	Not divided into regions. Separated from brain by layer of connective tissue. May be penetrated by small diverticula from nasopharyngeal duct. [31,38]	1
Protopterus: Dorsal to hypophyseal cleft; tube-shaped lobules with wide cavities. Closely attached to infundibular process lying rostrally to pars intermedia. [41]	Probably represented by "pars intermedia," tissue most intimately associated with neurohypophysis [18,32,33].	Interdigitates with infundibular process to form neurointermediate lobe [10,33].	Probably represented by most posterior part of adenohypophysis. Long and thin, and in close contact with neurohypophysis along entire length. [31,38]	Not visibly differentiated.	2
Protopterus: Possibly represented by rostral part of pars distalis [41].	Probably not represented.	Not distinguishable.	Not distinguishable.	Not distinguishable.	3
Protopterus: Gives rise to distinctly paired infundibular process, as branches and diverticula of the hypothalamus that intermingle with lobules of the pars intermedia. Median eminence is believed to be represented by an area in the floor of the third ventricle, just rostral to the anterior tip of the adenohypophysis; surface is indented by capillaries that communicate with sinusoids of adjacent adenohypophysis. [41]	Extensions of the floor of the hypothalamus interdigitate closely with the pars intermedia. Contains ends of neurosecretory fibers and accumulated neurosecretion originating mainly in the nucleus preopticus. Also interdigitates with adenohypophysis to a lesser extent. [24,32,33]	Infundibular process interdigitates with pars intermedia. Diffuse structure formed by endings of neurosecretory fibers originating in nucleus preopticus. [10,33] Median eminence on ventral surface of hypothalamus, with portal vessels vascularizing pars distalis [29].	Formed by thickened floor of diencephalon, particularly posterior part [31,38].	Caudally-directed, saclike projection of the hypothalamus represents infundibular process; thin-walled and unpaired, with many terminations of neurosecretory fibers. No contact with adenohypophysis. Well-vascularized, with a folded surface. Contains neurosecretion. [31,38]	4

	Gland or Tissue	Mammalia	Aves	Reptilia	Amphibia
	(A)	(B)	(C)	(D)	(E)
5	Thyroid	Two lateral lobes and a median isthmus; lateral lobes at sides of trachea, cranial ends at level of caudal edge of cricoid cartilage.	One pair of glands, situated at boundary of neck and thoracic cavity [7].	Single lobulate organ, lying close to trachea [9]. *Chrysemys:* Flattened mass ventral to truncus arteriosus [9].	Paired, widely separated lobes, closely associated with wings of hyoid cartilage (in almost all Amphibia).
6	Parathyroid	Usually two pairs, situated along dorsal-lateral border of the thyroid as anterior and posterior pairs. Accessory glands common along carotid arteries and in mediastinum. [19] Man: Two to six may be present. Anterior pair may be imbedded in thyroid. [19] Cat, dog: Anterior pair may be imbedded in thyroid [19]. Rat: Only posterior pair present. Visible on surface of thyroid. [19]	One or two pairs, developing from third and fourth branchial pouches. Situated posterior to thyroid glands. [7]	Usually two pairs, situated in neck; posterior and lateral to thyroid.	*Rana:* Two pairs, against jugular veins [13]. *Salamandra:* One pair of spherical bodies, derived from ventral ends of third and fourth branchial clefts. Widely separated from thyroids; lateral to arterial arches. Absent in some perennibranchiates *(Ambystoma, Necturus).* [13] Sauria: Situated at level of vagus ganglion [39].
7	Ultimobranchial bodies	Fused with thyroid tissue. Sometimes found aberrant in lateral neck tissues. [17]	Closely associated with, and may surround, parathyroid glands. Cell strands with some colloid-filled vesicles. [39]	Paired; groups of vesicles and strands, varying in position [39]. Serpentes: Situated against thyroid [39]. Reportedly absent in some snakes [17]. Sauria: Situated at level of vagus ganglion [39].	Gymnophiona, Salientia: Bilateral, at level of truncus arteriosus; vesicular. [13] *Salamandra:* Small single body near heart [13].
8	Adrenals	One pair, ovoid-shaped [23]. Eutheria: Situated immediately anterior to kidneys, with which adrenals may be in contact [23]. Eutheria, Metatheria: Adrenocortical tissue forms cortex, chromaffin tissue forms medulla [23]. Prototheria: Chromaffin tissue interdigitates with adrenocortical tissue [23].	One pair (occasionally fused), situated at anterior end of kidneys wholly or partly covered by gonads. Adrenocortical tissue forms anastomosing cords, with chromaffin tissue irregularly distributed in its meshes. [21]	One pair, elongated in shape. Adrenocortical tissue forms anastomosing cords; chromaffin tissue intermingled and also forming a peripheral layer. [23,40] Serpentes, Sauria: Anterior to kidneys [23, 40]. Crocodylia: Situated between, and anterior to, kidneys [23,40]. Chelonia: On ventral surface of kidneys. May fuse. [23,40]	*Salamandra:* Series of orange patches along ventromesial border of kidneys. May extend forward, in association with sympathetic ganglia, to subclavian artery. Brighter and more conspicuous in breeding season. [13,21] *Siren:* Situated between, and in front of, kidneys [13,21]. Chromaffin cells interspersed with cords of adrenocortical cells [13,21].

/1/ Corpuscles of Stannius, one or more of which lie in or on posterior kidney, were at one time regarded as

ENDOCRINE SYSTEM: VERTEBRATES

(F)	(G)	(H)	(I)	(J)	
	Diffuse follicles around ventral aorta [28]. *Scarus:* Follicles compact and encapsulated [28].	Compact organ lying at, or ventral to, anterior end of ventral aorta, between coracomandibular and coracohyoid muscles.	Elongated follicles extend from second to fifth branchial pouch, dorsal to medioventral cartilage of branchial basket [12].	Separate, large follicles scattered in loose connective tissue along most of ventral surface of pharynx [37].	5
	Reportedly absent.	Reportedly absent.	Reportedly absent.	Reportedly absent.	6
	Vesicular, glandlike bodies, often on left side only, or fused to median body, above pericardial wall. Parathyroid-like function has been suggested. [11,17,39]	Vesicles with colloid contents on left side only. Dorsal to pericardium (suprapericardial body). [8,39]	Reportedly absent [39].	Reportedly absent [39].	7
Exact limits of adrenocortical tissue doubtful. Probably present as small groups of cells between ventral margins of kidneys, and in walls of capillaries supplying posterior cardinal veins. [15,23] Chromaffin tissue present as groups of cells distributed along posterior cardinal veins. Also associated with intercostal arteries. [23]	Adrenocortical tissue present as areas of cells in the (usually lymphoid) pronephros. May be scattered *(Salmo)*, or arranged as layers of cells closely associated with cardinal veins. [1,23][1] Chromaffin tissue mainly in pronephros, as scattered cells or islets near or in walls of cardinal veins and their branches. [1,23]	Dogfish: Adrenocortical tissue present as elongated body between kidneys and close to cardinal vein, with additional small groups of cells anteriorly [21,23]. *Raja:* Adrenocortical tissue a horseshoe-shaped body, usually asymmetrical, with the two limbs extending anteriorly against inner sides of kidneys [21,23]. *Torpedo:* Adrenocortical tissue an oval body lying posteriorly on left kidney [21,23]. Chromaffin tissue present as paired series of suprarenal bodies along length of body cavity. Situated above cardinal veins and kidneys, or imbedded in kidneys. Variable shape, tending to be distributed in relation to segmental arteries. Some large bodies lie anteriorly. [21]	Adrenocortical tissue present as scattered islets of cells against ventral and lateral walls of cardinal veins in trunk and tail; also as groups of cells in pronephros and around kidney vessels. [16] Chromaffin tissue probably represented by groups of cells distributed along main arteries and veins in trunk [14].		8

adrenocortical tissue, but this now seems doubtful [17].

	(A)	(B)	(C)	(D)	(E)
9	Pancreatic tissue	Islets of Langerhans; small masses of tissue in pancreas. Principal cell types are α and β.	Islets of Langerhans in pancreas. More α than β cells. [17]	Islets of Langerhans in pancreas. More α than β cells. [17] Serpentes: Large aggregations of islets macroscopically visible at splenic end [5].	Islet tissue distributed throughout organ, ranging from single cells in exocrine acini to groups of cells [4, 17]. Caudata: β cells predominate [17].
10	Gonadal tissue	In testis, consists of interstitial (Leydig) cells between seminiferous tubules [32]. In ovary, probably represented by theca interna of graafian follicle and/or by interstitial cells of stroma. Progesterone-secreting cells of corpus luteum derived from granulosa cells of follicle, with perhaps a contribution from theca interna. [32]	Interstitial cells in testis [7].	Interstitial cells between seminiferous tubules of testis [27].	Interstitial cells in testis, conspicuous at breeding season.
11	Urohypophysis (Urophysis)

(F)	(G)	(H)	(I)	(J)	
	Organ usually diffuse. Islet tissue may be scattered but is often one large islet situated near spleen *(Lophius)*.	Islet tissue not well-identified. *Carcharhinus, Mustelus, Dasyatis:* Islet cells form a second epithelial layer around duct cells of pancreas. [36] *Raja:* Solid cords of islet cells contiguous to ducts of pancreas [36]. *Squalus acanthias:* Small islands of solid cell cords which are frequently separated from duct system of pancreas [36].	Islet tissue probably represented in ammocoete larva by groups of cells in wall of intestine adjacent to bile duct, and in adult by groups of cell cords in anterior wall of intestine [2,6].	Islet tissue possibly represented by cluster of cell cords in wall of intestine around bile duct [3,6].	9
	Gasterosteus, Oncorhynchus: Typical interstitial cells between tubules of testis [25,26]. *Esox:* Lobule boundary cells at periphery of testis lobules [25,26]. *Salmo gairdneri:* Both above types of endocrine tissue present [34].	*Chimaera, Scyliorhynus:* Probably interstitial cells between tubules of testis [25].		Interstitial cells reported in testis.	10
	Neurosecretory cells at hind end of spinal cord [17,22,35].	Neurosecretory cells (Dahlgren cells) at hind end of spinal cord [17].			11

V. NUTRITION AND DIGESTION

43. NUTRIENTS: CHEMICAL ELEMENTS

Accumulation in the tissues of an organism is not alone sufficient evidence that an element is required. *Abbreviations:* Capital letters indicate data are pertinent to all organisms studied; lower case letters and symbols indicate data apply to one or more species or strains, but not to all forms studied. R and r = required; R̸ = not required; u= = utilized as effectively as, replaces wholly, or is interchangeable with, another element; u< = can partially replace, or spare the use of, another element; s = stimulates growth or other processes; a = accumulates in the tissues; c = commonly present at similar concentrations in the food and tissues, but requirement is uncertain.

	Nutrient (Symbol)	Vertebrata	Invertebrata			Phyto-flagellata (green)[2]	Algae	Bacterio-phyta	Fungi		Spermato-phyta

Academic Press, New York. [27] Wigglesworth, V. B. 1961. The principles of insect physiology. Ed. 4. Methuen, London.

45. NUTRIENTS: PROTEINS, PEPTIDES, AND AMINO ACIDS

Amino acids not known to be required from the environment have been omitted (e.g., hydroxyproline, iodogorgoic acid, norleucine, ornithine, thyroxine). No distinction has been made between dextro- and levo-isomers, although the levo-isomers are usually nutritionally superior. In most studies with multicellular animals, microorganisms were present and in some instances supplied one or more amino acids. When requirement and utilization are noted together, at least one member of the group of organisms requires the amino acid specifically for energy or synthesis of other compounds, and other members, although not requiring it, utilize it as a general nitrogen source. *Abbreviations:* Capital letters indicate data are pertinent to all organisms studied; lower case letters and symbols indicate data apply to one or more species, or strains, but not to all forms studied. R and r = required; rm = required by one or more mutants; R̸ = not required; U and u = utilized as a source of nitrogen and/or carbon although not a specific requirement; ᵾ = replaces effectively one or more of the other amino acids, one of the interchangeable series being required in the diet; u̸ = not utilized; s = stimulates growth or other processes; * = serves as a complete nitrogen source; ** = serves as the simplest complete nitrogen source.

/1/ Including the colorless Phytoflagellata. /2/ Also Dinoflagellata and Chrysomonadina. /3/ Most species grow better on organic than on inorganic nitrogen. /4/ On the assumption that suitable amino acid combinations can replace complete proteins. /5/ Many species require living prey. /6/ *See* strepogenin (Table 48). /7/ Photoautotrophs, growing in the dark, require polypeptides, peptones, or amino acids. /8/ Some bacteria directly assimilate entire peptides, polypeptides, and low-molecular-weight proteins. /9/ ***Glaucoma scintillans, Herpetomonas culicidarum, Tetrahymena geleii,*** and ***Tritrichomonas foetus*** require arginine, histidine, isoleucine, leucine, lysine, methionine, phenylalanine, tryptophan, and valine; in addition, ***G. scintillans*** and ***T. foetus*** require glycine, proline, serine, and threonine, and ***H. culicidarum*** requires tyrosine. ***Paramecium aurelia*** requires arginine, histidine, isoleucine, leucine, lysine, methionine, phenylalanine, serine, threonine, tryptophan, and tyrosine. ***Trichomonas gallinae*** requires proline. ***Tetrahymena geleii*** needs no other carbon source. /10/ Various species and varieties differ markedly in utilization. /11/ Based mainly on ***Chlorella pyrenoidosa.*** /12/ Species differ widely in requirement. /13/ Amino acid mixtures are superior to NH_4^+ as a nitrogen source for some fungi (e.g., ***Saccharomyces cerevisiae, S. carlsbergensis***). /14/ Several tested intact plants (tomato, tobacco, clover, pea, orchid embryo, young orchid) grew on single amino acids as the sole nitrogen source. Growth attained on some amino acids is superior to that achieved with NH_4^+ or NO_3^- as the nitrogen source; on other amino acids the effect is inferior. Some plants grow less well on amino acids than on inorganic nitrogen. Species differ markedly in amino acid utilization. /15/ Interchangeable for a ***Neurospora*** mutant. /16/ Required by rat and chicken. /17/ Arginine and citrulline are interchangeable for some insects; citrulline can partly replace arginine in ***Drosophila melanogaster.*** /18/ ***Phormia regina*** seems to require aspartic acid or glutamic acid, but not both. /19/ Some species apparently require either cystine or methionine, but not both, and proline. ***Blattella germanica*** requires neither cystine nor methionine in the presence of inorganic sulfates; threonine and tryptophan possibly are not required. /20/ Required by chick for rapid growth.

46. NUTRIENTS: PURINES AND PYRIMIDINES

Purine and pyrimidine compounds are essential components of the nucleic acids. Inability to synthesize these compounds makes it necessary for many organisms to obtain them from the environment or diet. For some organisms the requirement is for a specific compound, or compounds; for others any one of an interchangeable series of compounds satisfies the need. *Abbreviations:* Capital letter indicates data are pertinent to all organisms studied; lower case letters and symbols indicate data apply to one or more species, or strains, but not to all forms studied. R̸ = not required; r = required; rm = required by one or more mutants; u = utilized; u̸ = not utilized; u= = utilized as effectively as, or is interchangeable with, one or more related compounds, the presence of at least one of the series being required; u< = partially replaces, or spares the use of, one or more required, or interchangeably required, compounds; s = stimulates growth or other processes; i = inhibits growth or other processes.

47. NUTRIENTS: VITAMINS AND RELATED COMPOUNDS

It is probable that many vitamins and related compounds are indispensable participants in the metabolic activities of all living substances, and are in this sense universally "required." Data, however, have been limited to the presently known requirement, or non-requirement, for compounds obtained from the external environment or in the diet, and do not include metabolically essential compounds provided to an organism by associated microorganisms (e.g., by the intestinal flora of mammals). *Abbreviations:* Capital letters indicate data are pertinent to all organisms studied; lower case letters and symbols indicate data apply to one or more species, or strains, but not to all forms studied. R and r = required; Ɍ = not required; rm = required by one or more mutants; u = utilized; u= = utilized as effectively as a related vitamin or compound; u> = utilized more effectively than a related vitamin or compound; u< = utilized less effectively than a related vitamin; u̸ = not utilized in place of the related vitamin; s = stimulates growth or other processes; i = inhibits growth or other processes.

/1/ Including the colorless Phytoflagellata. /2/ Also Dinoflagellata and Chrysomonadina. /3/ "Vitamin L_2," a purine nucleoside. /4/ "Vitamin L_1," precursor of nicotinic acid. /5/ Substitutes for tryptophan and/or indole. /6/ Aureomycin, penicillin, streptomycin, bacitracin, neomycin, and other anti-infectious substances (e.g., arsenicals and sulfonamides which in small amounts may stimulate growth). /7/ Required by "dependent" mutants. /8/ Required as growth factor and not replaceable by aspartic or glutamic acids. /9/ Required by some colorless Phytoflagellata. /10/ Required although another carbon source is available, particularly in darkness. Functions in metabolism of C_3 and C_4 compounds. /11/ Required in higher-than-atmospheric concentrations by some species. /12/ α-Hydroxy-γ-aminobutyric acid. /13/ Required by *Tenebrio molitor;* interchangeable with γ-amino-β-hydroxybutyric acid. /14/ Fe-containing molecule of unknown structure; not a heme compound. /15/ Favors larval growth of *Drosophila* and *Aedes aegypti.* /16/ Required by *Neisseria gonorrhoeae.* /17/ Possibly required in vitro by *Plasmodium;* not required by *Tetrahymena.* /18/ And related auxins (plant hormones). /19/ Ineffective for *Astasia* (colorless counterpart of *Euglena*); stimulates growth of *Euglena gracilis* (green Phytoflagellata). /20/ Also hemin, protohemin, protoporphyrin, and several other porphyrins. /21/ Acetate, citrate, fumarate, α-ketoglutarate, oxalacetate, succinate, *cis*-aconitate, isocitrate, malate, and oxalosuccinate. /22/ Several intermediates are utilized for growth by the "acetate" flagellates; acetate is utilized by most species. There is wide variation among species with respect to utilization or availability of individual Krebs intermediates and related compounds, such as pyruvate.

Part II. NITROGEN SOURCES

Nitrogen is a universal requirement of living organisms. Although some utilize it as molecular nitrogen, most organisms require it in the form of compounds. *Abbreviations:* Capital letters indicate data are pertinent to all organisms studied; lower case letters and symbols indicate data apply to one or more species, or strains, but not to all forms studied. R and r = required; R̸ = not required; rm = required by one or more mutants; U and u = utilized; U̸ and u̸ = not utilized; s = stimulates growth or other processes; * = serves as adequate or partial nitrogen source; ** = simplest adequate nitrogen source.

	Nitrogen Source	Vertebrata	Invertebrata: Insecta	Invertebrata: Protozoa[1]	Phytoflagellata (green)[2]	Algae	Bacteriophyta	Fungi: Saccharomycetaceae	Fungi: Other	Spermatophyta
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)	(I)	(J)
	Inorganic Nitrogen									
1	Nitrogen, molecular, N_2	U̸	U̸	U̸	U̸	R̸, u**[3]	u**[4]	R̸	R̸, u?[5]	u[6]
2	Ammonia, NH_3; ammonium, $-NH_4^+$	R̸, u[7]	R̸, u?	r, u**	R̸, U**	R̸, U**[8]	R̸, u*[9]	R̸, u**	rm, u**[10]	R̸, U**
3	Hyponitrite, $-HN_2O_2^-$ or $-N_2O_2^=$	R̸	R̸	R̸	R̸	R̸	R̸, u[11]	......	R̸, u̸[12]	R̸, u̸[13]
4	Nitrite, $-NO_2^-$	R̸	R̸	R̸	R̸	R̸, u*[14]	R̸, u*	R̸, u*	rm, u**[15]	R̸, u*[16]

/1/ Including the colorless Phytoflagellata. /2/ Also Dinoflagellata and Chrysomonadina. /3/ Utilized in nitrogen fixation by blue-green algae (Nostocaceae). Not utilized if hydrogen or carbon monoxide are present. /4/ Utilized by nitrogen-fixing bacteria. /5/ Evidence is conflicting for nitrogen fixation. /6/ Utilized via symbiotic bacteria, as in root nodules of legumes. /7/ Ruminants, and possibly other vertebrates, utilize dietary NH_4^+. NH_4^+ originating as a metabolic intermediate is utilized in amino acid synthesis. /8/ Utilized by *Chlorella* in preference to NO_3^-. /9/ Many bacteria require specific amino acids from the environment, but as a class they utilize NH_4^+ for synthesis of other amino acids. /10/ Utilized by *Phycomyces blakesleeanus* (Mucorales). Probably utilized by all fungi. /11/ Utilized by *Clostridium pasteurianum* but not for growth; not utilized for denitrification by *Pseudomonas stutzeri*. /12/ Not utilized by *Aspergillus niger*. /13/ Not utilized by *Nicotiana*. /14/ Utilized poorly by *Chlorella pyrenoidosa*. /15/ Utilized as sole nitrogen source by many fungi. /16/ Toxic to many plants; poorly utilized by *Nicotiana*. /17/ Utilized in light. /18/ Not utilized by purple photosynthetic bacteria. /19/ Poorly utilized by most yeasts. /20/ Acts as sole hydrogen acceptor in anaerobic metabolism of *Aspergillus niger*. Required by some species when manitol is the carbon source. Some species require NO_3^-.

/1/ Including the colorless Phytoflagellata. /2/ Also Dinoflagellata and Chrysomonadina. /7/ Ruminants, and possibly other vertebrates, utilize dietary NH_4^+. NH_4^+ originating as a metabolic intermediate is utilized in amino acid synthesis. /9/ Many bacteria require specific amino acids from the environment, but as a class they utilize NH_4^+ for synthesis of other amino acids. /21/ Good nitrogen source for *Aspergillus niger*. /22/ Good nitrogen source for *Nicotiana*. /23/ Toxic. /24/ Utilized by *Aspergillus niger* when nitrogen-starved. /25/ Many species utilize cyanamide and derivatives. /26/ Including hydroxylamine. /27/ Hydroxylamine is toxic. /28/ *Clostridium perfringens* utilizes hydroxylamine; *Nitrosomonas* utilizes a nontoxic concentration. /29/ Hydroxylamine is poor nitrogen source. /30/ Alkylamines, as methylamine (CH_3NH_2), and arylamines, as benzylamine ($C_6H_5CH_2NH_2$). /31/ All organisms studied utilize glucosamine. /32/ *Aspergillus* utilizes formamide and other acid amides; utilizes both amino and amide nitrogen of asparagine. /33/ Some species utilize acetamide. /34/ Utilized by ruminants via rumen microflora. /35/ Utilized by *Astasia longa*. /36/ L-Arginine, glutamine, cysteine and L-asparagine support more rapid growth of *Chlorella* than does NH_4^+. /37/ Including peptones, synthetic di- and tri-peptides, strepogenin, and glutathione. /38/ Proteins, per se, are listed as "not required" for vertebrates, since only certain amino acids are required.

Part III. SULFUR SOURCES

Sulfur occurs in several amino acids: cysteine, cystine, and methionine. Methionine is required by all animal forms studied and may be essential in the protein structure of all living organisms. Sulfur occurs also in chondroitin sulfuric acid, a component of vertebrate connective tissue, and in sulfolipids found in the white matter of the brain and in other tissues. *Abbreviations:* Capital letters indicate data are pertinent to all organisms studied; lower case letters and symbols indicate data apply to one or more species, or strains, but not to all forms studied. R and r = required; R̸ = not required; rm = required by one or more mutants; U and u = utilized; U̸ = not utilized.

	Sulfur Source	Vertebrata	Invertebrata		Phytoflagellata (green)[2]	Algae	Bacteriophyta	Fungi		Spermatophyta
			Insecta	Protozoa[1]				Saccharomycetaceae	Other	
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)	(I)	(J)
	Inorganic Sulfur									
1	Sulfur[3] (elemental), S	R̸, u[4]	R̸	R̸	R̸	R̸, U̸	r[5]	u	u[6]	R̸, U̸

/1/ Including the colorless Phytoflagellata. /2/ Also Dinoflagellata and Chrysomonadina. /7/ *Synechococcus*, grown in an atmosphere of nitrogen, utilizes Na_2S (with reduction of CO_2); *Oscillatoria & Pinnularia* reduce CO_2 with H_2S, depositing sulfur in their cells; *Scenedesmus* also utilizes sulfide. H_2S toxic to *Chlorella*. /8/ Utilized (e.g., by *Beggiatoa, Thiothrix, Thioploca, Thiobacillus*). /9/ Utilized by some aquatic fungi (e.g., members of Blastocladiales and Saprolegniales which cannot utilize oxidized sulfur but require a reduced sulfur source: H_2S, cysteine, cystine, methionine, thioacetate, thiocarbonate, thioglycolate, thiourea). /10/ Utilized by *Brevilegnea gracilis;* not utilized by many other Saprolegniaceae. /11/ Utilized by *Desulfovibrio desulfuricans* and *D. aestuarii*. /12/ Utilized for formation of chondroitin sulfate and heparin; utilized by laying hens via conversion to cystine. /13/ Utilized by *Thiobacillus novellus, Pseudomonas aeruginosa, P. fluorescens*, and others. /14/ Decomposes on contact with water. /15/ Inorganic sulfur, less oxidized than sulfinate, is not efficiently utilized by *Aspergillus niger*. /16/ *Thiobacillus thiooxidans* can utilize NH_4SCN as the sole source of carbon, nitrogen and sulfur. /17/ Compound may be a sulfur source, or may be required for its molecular structure; not synthesized by the organism. /18/ Also utilize cysteic acid and isethionic acid. /19/ Utilized as nitrogen source (and sulfur source?) by *Chlorella pyrenoidosa*. /20/ Also utilize methionine sulfoxide, taurine. /21/ Numerous fungi, yeasts, bacteria, and most of the vertebrates and invertebrates studied, require biotin. The replacement of sulfur in the biotin molecule does not affect the activity for some bacteria. /22/ Complex of cysteine, glycine, and glutamic acid. /23/ Thiamine, containing pyrimidine and thiazole (the latter an imidazole ring with one carbon atom replaced by sulfur) is required by numerous organisms; probably also a sulfur source. /24/ Satisfies thiamine requirement for some (*see* Fn. 23); probably a sulfur source. /25/ Not utilized as a sulfur source by *Aspergillus niger* (cannot rupture the thiazole ring ?). /26/ Protogen, or α-lipoic acid. /27/ Required by *Tetrahymena geleii* (8 strains), and *T. vorax* (2 strains). /28/ Required by *Streptococcus faecalis* for oxidation of pyruvate. /29/ Utilized by *Penicillium brevicaule* and *Schizophyllum commune*. /30/ Not utilized by Saprolegniaceae.

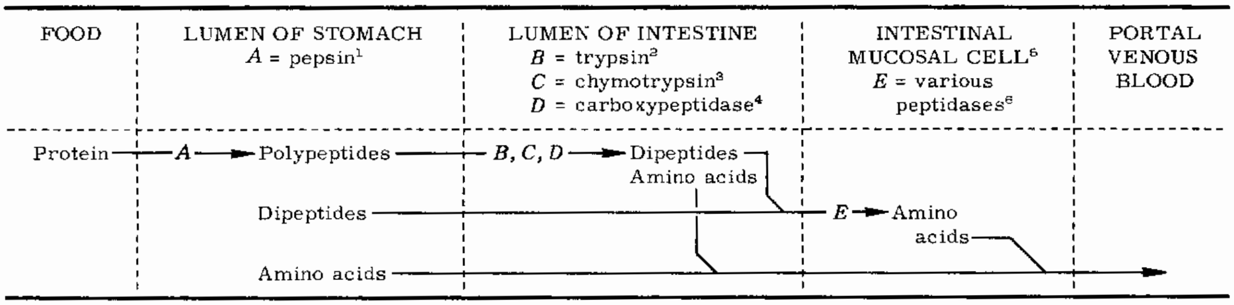
50. PATHWAYS OF PROTEIN DIGESTION: MAN AND LABORATORY MAMMALS

Pepsin, trypsin, and chymotrypsin are endopeptidases, i.e., they hydrolyze peptide bonds in the interior of peptide chains as well as terminal bonds. Carboxypeptidase and leucine aminopeptidase are exopeptidases and can act only on terminal peptide bonds.



/1/ Pepsin hydrolyzes many types of peptide bonds but splits most rapidly those in which an aromatic amino acid provides the amino group. /2/ Trypsin hydrolyzes peptide bonds to which L-arginine, or L-lysine, contributes the carbonyl group. /3/ Chymotrypsin hydrolyzes many types of peptide bonds but splits most rapidly those in which an aromatic amino acid contributes the carbonyl group. /4/ Carboxypeptidase does not exhibit absolute specificity with respect to the terminal amino acid forming the bond being split; it acts most rapidly on those linkages in which aromatic amino acids are in the terminal position. The terminal amino acid must have a free carboxyl group. /5/ Amino acids and dipeptides enter the intestinal mucosal cells. Amino acids pass through unaltered--with a few exceptions, such as transamination of glutamic acid--and dipeptides are split to amino acids in the microvilli of the cell where the peptidases are localized. /6/ Only a few of the intestinal mucosal peptidases have been characterized. The best known is leucine aminopeptidase.

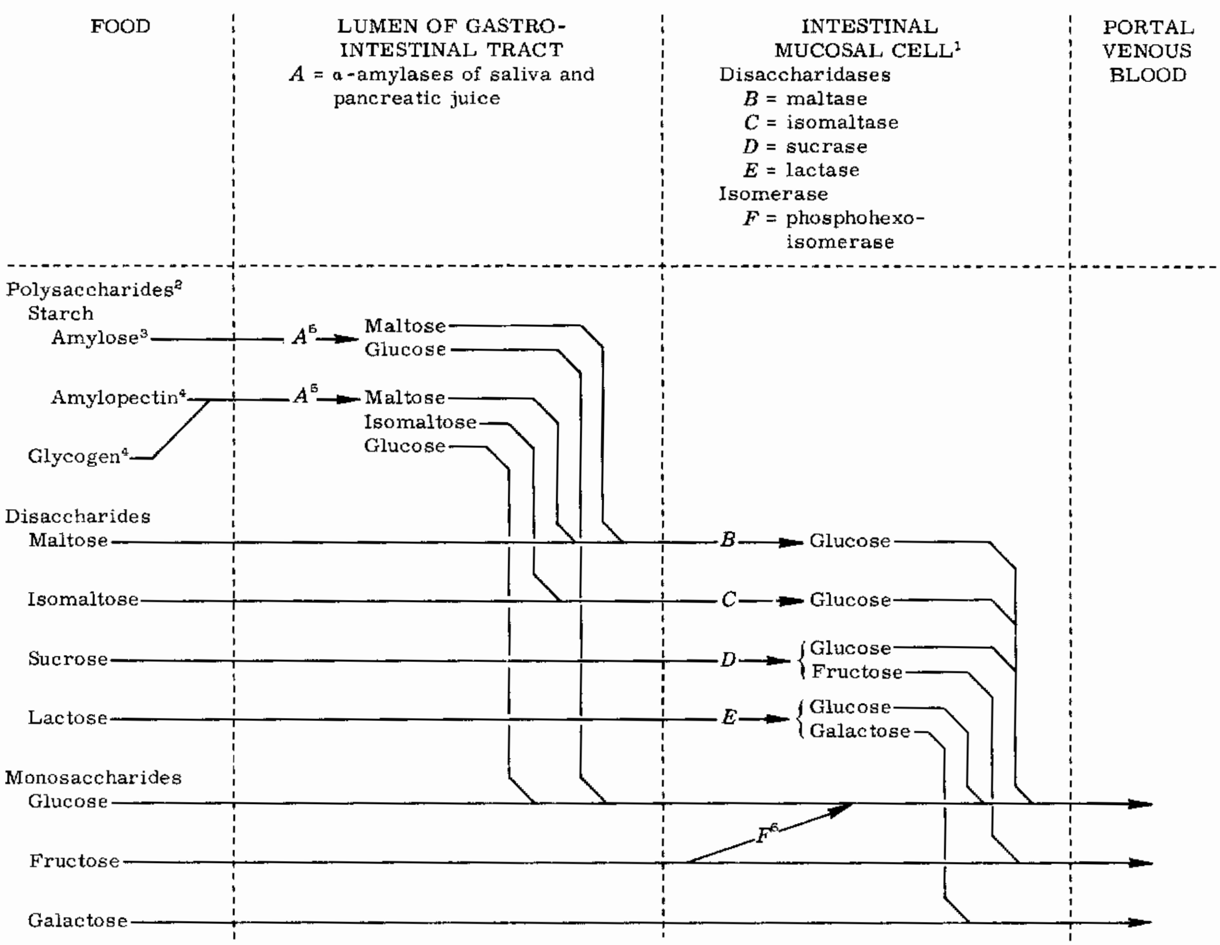
51. PATHWAYS OF CARBOHYDRATE DIGESTION: MAN AND LABORATORY MAMMALS



/1/ Dihexoses and monohexoses are absorbed into the intestinal mucosal cell. Within the microvilli of the intestinal mucosal cell, the dihexoses are split to monohexoses. Apart from the small fraction of hexose metabolized (oxidized) during passage through the intestinal mucosal cell, phosphorylation of hexoses does not occur as a mechanism for absorption of hexoses into the cell or for delivery from the cell into the portal blood. /2/ A number of so-called structural polysaccharides occurring in foods are not digestible in the alimentary tract of vertebrates and so pass into the feces essentially unaltered. These include cellulose, lignin, mannan, xylan, pectic acids, alginic acid, and chitin. /3/ Amylose is a straight chain polymer of glucose with alpha 1-4 glucosidic linkages. /4/ Amylopectin and glycogen are branched chain polymers of glucose with alpha 1-4 linkages in the straight chain portions and alpha 1-6 linkages at the points of branching. /5/ α-Amylase hydrolyzes 1-4 glucosidic linkages in chains of glucose containing three or more residues; it does not split maltose. α-Amylase does not split the 1-6 linkages in amylopectin. /6/ Some fructose is transformed to glucose in the intestinal mucosal cell and some passes through unchanged.

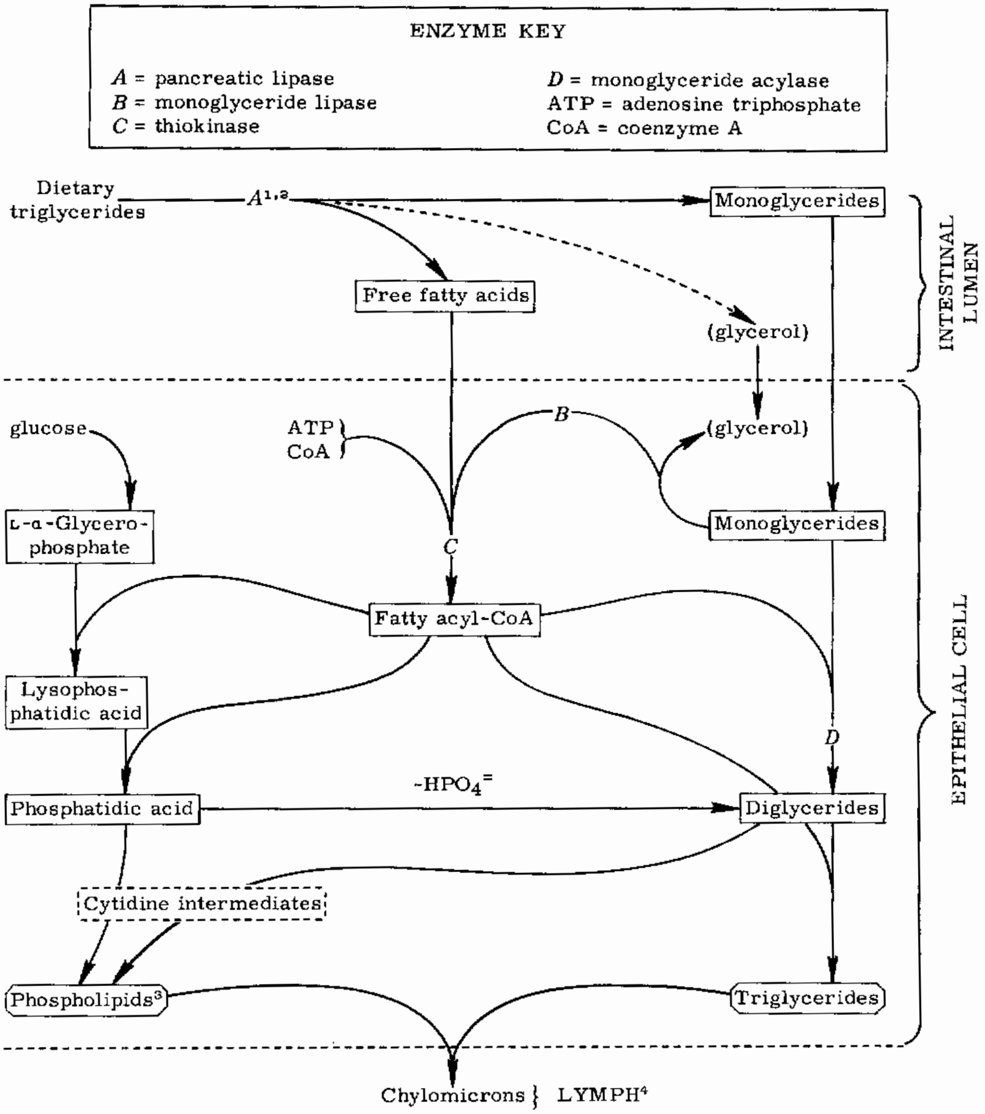
52. PATHWAYS OF LIPID DIGESTION: MAN AND LABORATORY MAMMALS



/1/ Pancreatic lipase acts preferentially on ester linkages at the terminal or 1 position of glycerol. Thus the major products of digestion are fatty acids and monoglycerides. /2/ Bile salts, in their conjugated form, participate in at least three reactions during fat digestion and absorption: (i) as a cofactor for pancreatic lipase; (ii) to form micelles containing monoglyceride and fatty acid, as well as other lipids (these micelles are probably the form in which lipid is absorbed into the cell); (iii) as a cofactor for thiokinase in the intestinal mucosal cell. /3/ Absorbed fatty acids go mainly into the triglycerides of chylomicrons, but small amounts are synthesized into cholesterol esters and phospholipids which also are constituents of chylomicrons. /4/ Fatty acids with chain lengths shorter than ten carbon atoms are absorbed mainly into the portal blood, those with longer chain lengths mainly into the lymph.

53. EXCRETION PRODUCTS: MAN

Values are based on "normal" dietary intake, including approximately 10 grams of nitrogen per day. In reducing values to mg/kg or µg/kg, a body weight of 70 kg was assumed, unless specific weight was reported in the literature. Values in parentheses are ranges, estimate "c" (cf. Introduction).

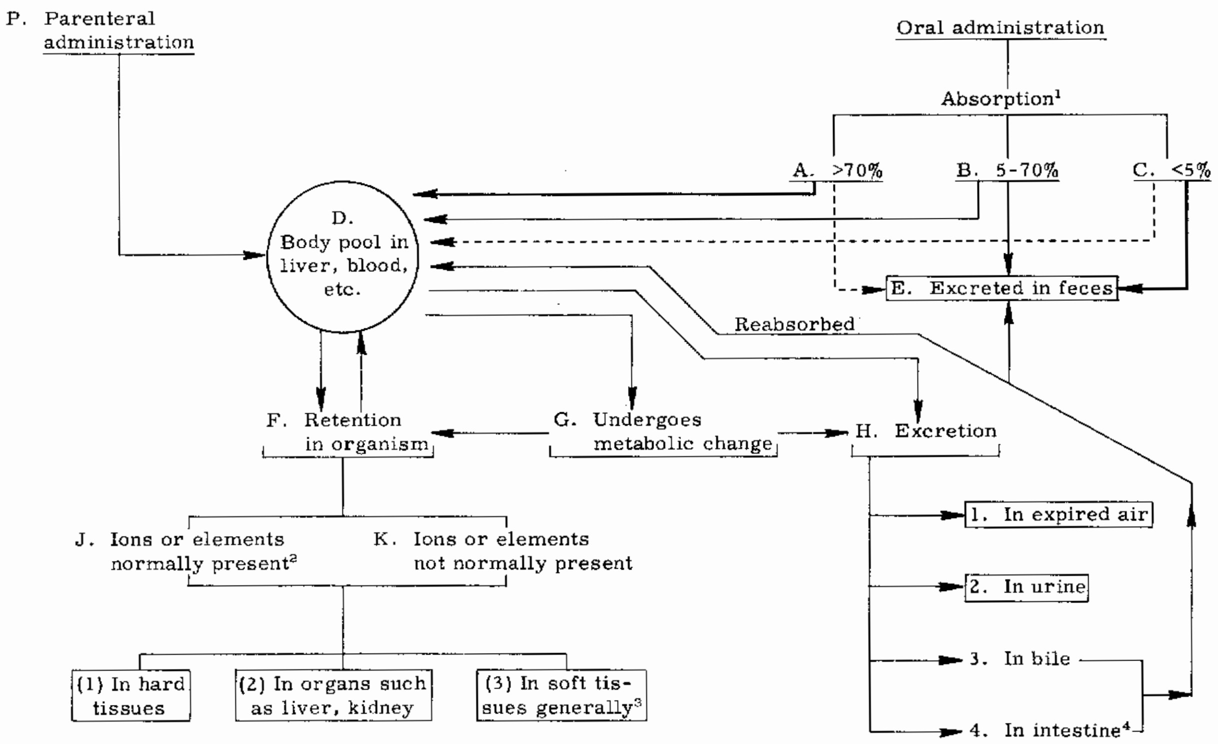
VI. METABOLISM

DIAGRAM FOR TABLE 54



/1/ Percent absorption from oral administration has in some cases been rather arbitrarily classified, since the extent of absorption may depend on the amount administered and on the presence or absence of food residues in the digestive tract. /2/ Some trace elements with no known function also included. /3/ Primarily muscle, skin, and extracellular fluids. /4/ Other than in the bile, or by a route not definitely established.

54. PATHWAYS OF MINERAL METABOLISM: LABORATORY MAMMALS

The course, or courses, of various ions during metabolism can be located in the diagram (at left) by tracing the combination of letters and numbers accompanying each ion (columns B and C below). Observations were made on a wide variety of mammalian species. Ions were administered in the form of simple soluble compounds or metallic oxides, unless otherwise specified. Underscoring indicates radioactive elements, or that data were obtained at least in part from studies using radioactive isotopes. Different isotopes of the same element may show different tissue predilections, but there is usually no difference in their absorption or route of excretion. "Plus" symbols indicate valence states to which data apply. **Other Known Pathways** (column C) are listed, so far as possible, in order of decreasing importance.

	Ion	Principal Oral Pathways[1]	Other Known Pathways	Reference
	(A)	(B)	(C)	(D)
	Cations[2]			
1	Actinium	CE	PDFK(1, 2)	10
2	Aluminum	CE	PDH2, PDH3, PDFJ(2)	40,91,93
3	Americium	CE	PDH4, PDFK(2, 1), PDH2	88,102
4	Antimony^{+++}	BE, BDH2	BDFK(2, 3), BDH4	31,34,40,93
5	Arsenic^{+++}	BE, BDH2	BDFK(2, 3), BDH4	16,40,54,58,93
6	Barium	BE, BDH4	BDFK(1), BDH2	12,36,69,93,102
7	Beryllium	CE	PDFK(1, 3, 2), PDH2, PDH4	83,93
8	Bismuth^{+++}	CE	PDFK(2), PDH4, PDH2	40,57,93
9	Cadmium	CE	PDFK(2, 3, 1), PDH4, PDH2	20,23,40,78,93,110
10	Calcium	BE, BDFJ(1)	BDH4, BDH3, BDH2, BDFJ(3)	3,19,40,75,92,97,103,110,111
11	Cerium[3]	CE	PDFK(2, 1), PDH3, PDH2	23,24,40,46,94,102
12	Cesium	ADH2	ADH3, ADH4, ADFJ(3)	36,52,71-74,90,93
13	Chromium^{+++}	CE	PDH2, PDH4, PDFK(2, 1)	23,25,50,106
14	Cobalt^{++}	BE, BDH2	BDH3, BDH4, BDFJ(2)	5,17,19,40,56,93,110
15	Copper^{++}	BE, BDH3	BDH2, BDFJ(2)	19,40,64,93,110
16	Curium	Probably CE[4]	PDFK(2, 1), PDH4, PDH2	86, 102
17	Dysprosium[3]	....	PDH3, PDFK(1)	24
18	Erbium[3]	....	PDH3, PDFK(1, 2)	24
19	Europium[3]	CE	PDH3, PDH2, PDFK(1, 2)	24
20	Francium	Probably ADH2[4]	PDFK(2, 3)	76
21	Gadolinium[3]	....	PDH2, PDH3, PDFK(1, 2)	24
22	Gallium	CE	PDH2, PDFK(1, 2), PDH4	22,53,93
23	Germanium	ADH2	ADH4, ADFK(2)	93
24	Gold^{+++}	CE	PDFK(2), PDH2, PDH4	34,40,79,93
25	Hafnium[3]	....	PDFK(2, 1), PDH2, PDH4	47,93
26	Holmium[3]	....	PDH3, PDFK(1, 2)	24
27	Indium	CE	PDFK(3, 1, 2), PDH4, PDH2	23,39
28	Iridium	CE	PDH2, PDH4, PDFK(3, 2, 1)	23
29	Iron^{++}	CE	PDH4, PDFJ(2)	19,40,65,93,110,111
30	Lanthanum[3]	CE	PDH2, PDH3, PDFK(2, 1)	13,23,24,36,40,93,95,102
31	Lead^{++}	BE, BDH4	BDH2, BDFK(1, 3, 2)	1,9,23,34,35,40,57,82,93
32	Lithium	ADH2	ADH4, ADFJ(3, 2)	30,35,81,93
33	Lutetium[3]	....	PDH3, PDFK(1)	24
34	Magnesium	BE, BDH2	BDH3, BDFJ(1, 2, 3)	2,40,91,93,110
35	Manganese^{++}	CE	PDH3, PDH4, PDFJ(2, 3)	8,19,28,40,60,66,93
36	Mercury^{++}	BE, BDH2	BDFK(1, 2, 3), BDH3, BDH4	23,40,93
37	Neodymium[3]	Probably CE[4]	PDH2, PDFK(2, 1), PDH3	23,24,38,40,55
38	Neptunium	CE	PDFK(1)	36
39	Nickel^{++}	BE, BDH2	BDH4, BDFJ(2)	5,35,40,93,98,108,110
40	Niobium[3]	CE	PDH2, PDH4, PDFK(2, 1, 3)	13,23,36,80,102
41	Palladium	Probably CE[4]	PDH2, PDH4, PDFK(2)	23,40,67
42	Platinum	CE	PDH2, PDH4, PDFK(2, 3, 1)	23,40
43	Plutonium[3]	CE	PDFK(1, 2), PDH4, PDH2	11,29,36,84,89,102,109
44	Polonium	CE	PDFK(2, 1, 3), PDH4, PDH2	27,44,93,96,102

/1/ Ions may be assumed to follow the same pathways when given parenterally. /2/ Because of inadequate information, no pathways have been listed for berkelium, californium, einsteinium, fermium, and mendelevium. /3/ Usually given as soluble complex. /4/ As judged from the position of the element in the periodic table, or on solubility at neutral pH values.

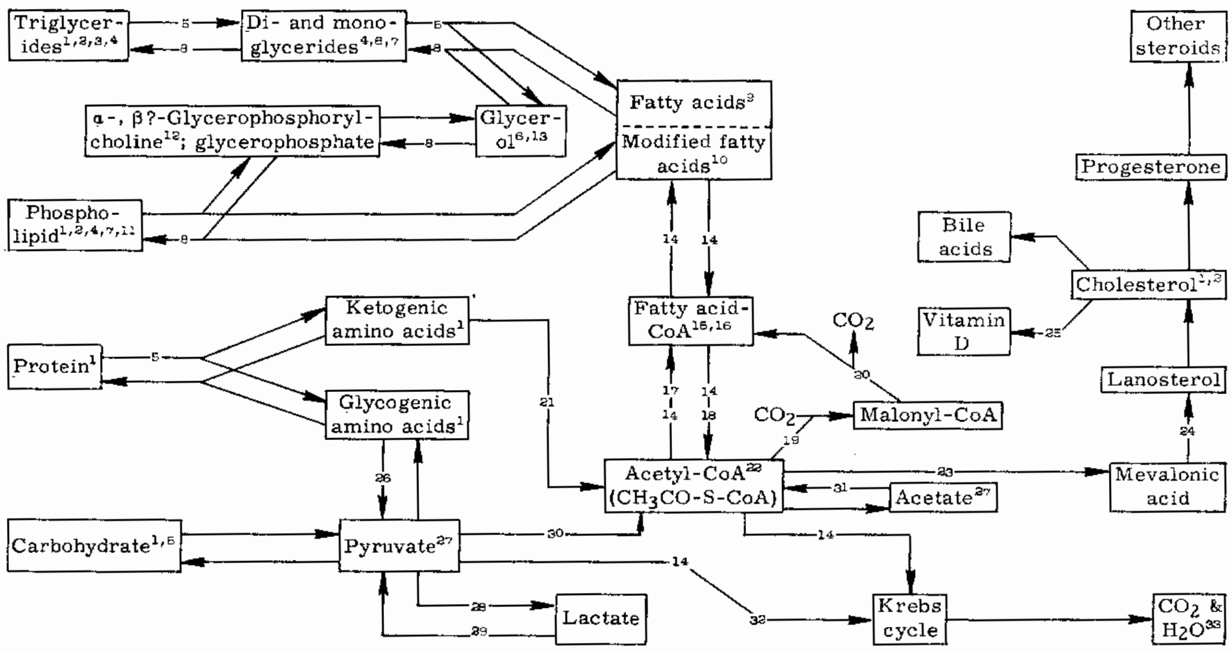
55. PATHWAYS OF LIPID METABOLISM: MAMMALS

Pathways are based on studies confined chiefly to mammals.



/1/ In intestinal lumen, blood, liver, other tissues. /2/ In chyle. /3/ Absorption by intestinal mucosa questionable. /4/ Formed in intestinal mucosa, or absorbed from lumen; pass into chyle. Short chains possibly also pass into portal blood. /5/ Digestion in intestinal lumen. /6/ Probably transitory in tissues. /7/ Some absorption by intestinal mucosa. /8/ In intestinal mucosa, liver, other tissues. /9/ Occur free (ionized) in intestinal lumen, blood, liver, but certain unsaturated fatty acids must be obtained from the diet. Free existence in chyle questionable; probably transitory if free existence occurs in other tissues. /10/ In liver, carbon chains are lengthened or shortened (*see* footnote 18), and H is added to C_{9-10}, or removed creating double bonds. /11/ Chiefly lecithin, cephalins (phosphatides of ethanolamine, serine, inositol, acetal, polyglyceride), and some sphingomyelin. /12/ In intestinal mucosa, liver (?), and other tissues (?). Split to choline, glycerol, phosphoric acid. /13/ In intestinal lumen; absorbed by intestinal mucosa and resynthesized into glycerides, including phospholipids. Metabolized to pyruvate. /14/ In liver and other tissues. /15/ Fatty acid ester of CoA (i.e., acyl-CoA ester) is formed by ATP-dependent acylation of CoA, or by transfer of CoA from succinyl- or other CoA ester. /16/ CoA = pantetheine (pantoic acid + β-alanine + thioethanolamine) + ADP, with a third PO_4 at the ribose; forms fatty acid thiol esters via the SH in thioethanolamine. /17/ Reverse of β-oxidation (*see* Fn. 18); NADPH required; mitochondrial pathway. /18/ Fatty acid ester of CoA is shortened 2 carbons at a time by β-oxidation, breaking off a molecule of acetyl-CoA at each step and re-esterifying the remainder with CoA. /19/ Biotin-dependent carboxylation to malonyl CoA. /20/ 7 acetyl → 7 malonyl, then 1 acetyl + 7 malonyl → 1 palmityl-CoA; NADPH required; extra mitochondrial pathway. /21/ Tyrosine, leucine, and isoleucine also converted directly to acetoacetate. /22/ Acetic acid ester of CoA known also as *S*-acetyl-CoA, active acetyl. /23/ Through intermediates--acetoacetyl-CoA, β-hydroxy-β-methyl-glutaryl-CoA, and mevaldic acid. /24/ Through intermediates--farnesel and squalene. /25/ Requires light. /26/ Aspartate enters Krebs cycle not via pyruvate, but by conversion directly to oxalacetate. /27/ Occurs in blood, liver, muscle, other tissues. /28/ Occurs in muscle, especially in exercise, the lactate diffusing into the blood stream. /29/ Occurs in liver, muscle, brain, and other tissues. /30/ Diphosphothiamine (cocarboxylase), lipoic acid, Mg++, and NAD^+ required. /31/ ATP-dependent reaction with CoA. /32/ Pyruvate + CO_2 → oxalacetate, and malate, components of Krebs cycle. Oxalacetate condenses with acetyl-CoA, to form citrate. This removal of acetyl-CoA by oxalacetate (i.e., by pyruvate), occurring when acetyl-CoA is being formed in active fat catabolism, may explain antiketogenic action of carbohydrate (and protein). /33/ And energy liberation.

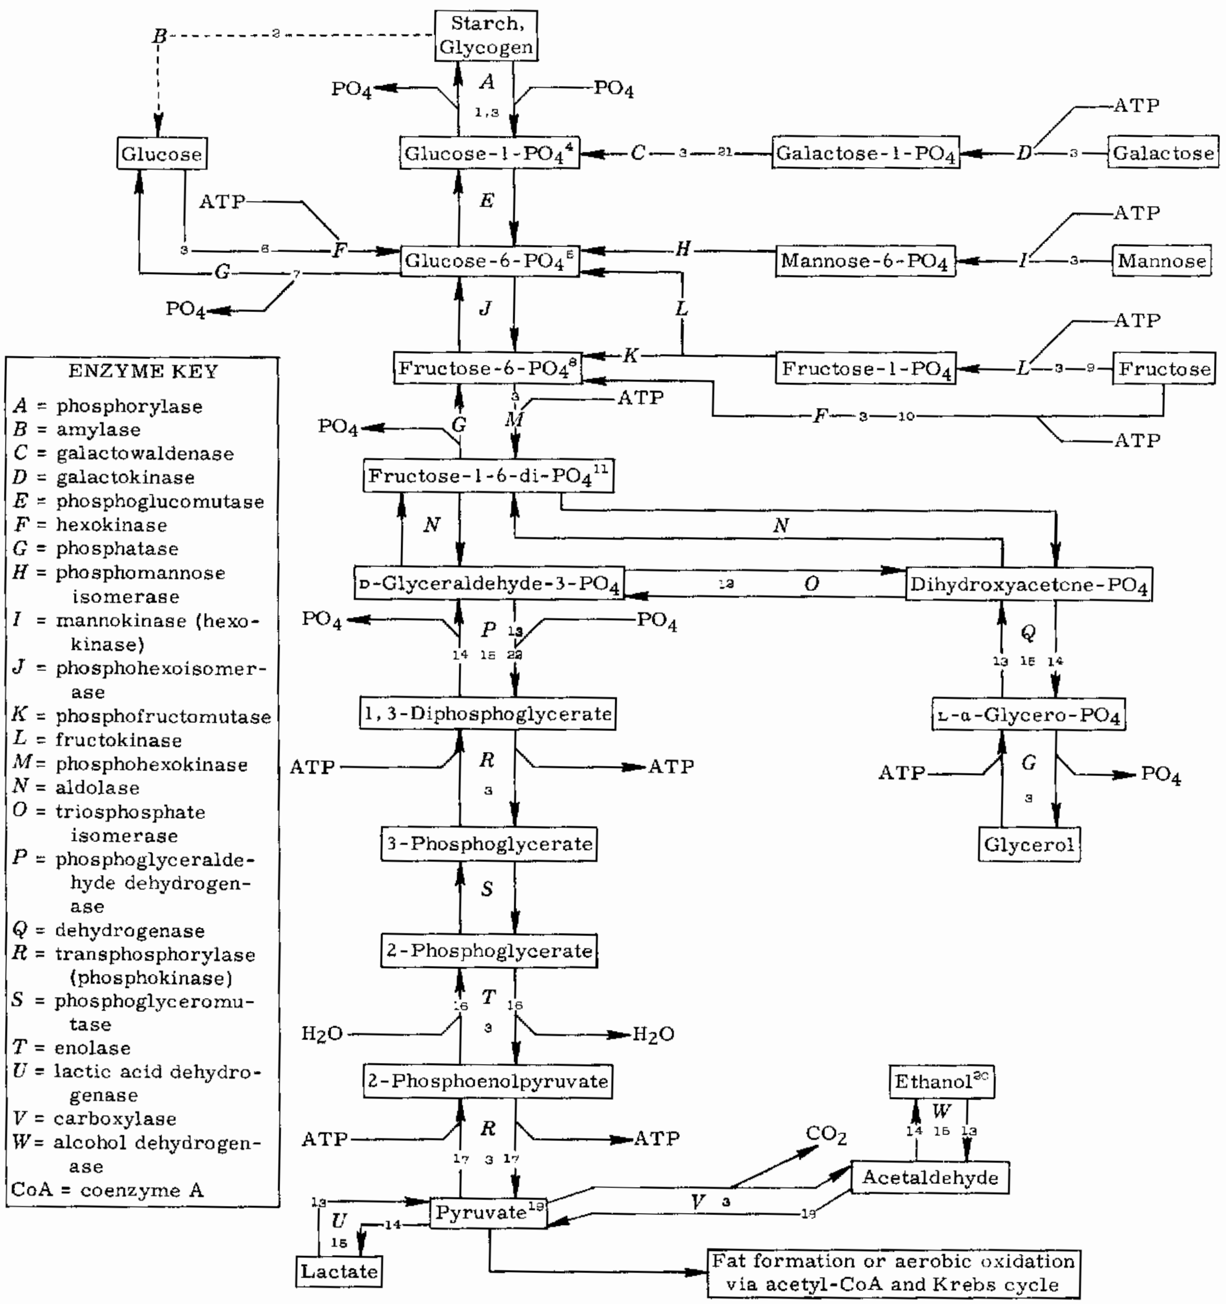
56. PATHWAYS OF CARBOHYDRATE METABOLISM

The conversion of stored or ingested carbohydrate to pyruvate releases stored energy by means of anaerobic oxidation (glycolysis). Released energy is partly dissipated as heat and partly stored (temporarily) in the labile energy pool as high-energy phosphate (-PO_4) by combination of -PO_4 with continuously available ADP (adenosine diphosphate) to form ATP (adenosine triphosphate). In the conversion of 1 mole of glucose (180 g), or of other monosaccharides, to 2 moles of pyruvate (174 g), 2 moles of ATP are converted to ADP and 4 moles of ATP are formed from ADP, making a net gain of 2 moles of ATP, or approximately 14 kilocalories of readily available energy. If glucose-6-PO_4 has come from the metabolic breakdown of glycogen, the cost is only 1 mole of ATP, making a net gain of 3 moles of ATP (approximately 21 kilocalories). The ATP is an immediate source of energy, the utilization of which (e.g., for muscular activity) is independent of oxygen supply. Aerobic oxidation of the reduced coenzymes formed in glycolysis and in the Krebs cycle yields considerable amounts of energy. The reactions may be summarized as follows: glucose + 2 ATP → 2 pyruvate + 8 ATP; 2 pyruvate → 2 acetyl CoA + 6 ATP; 2 acetyl CoA → 4 CO_2 + 4 H_2O + 24 ATP; a total of 38 ATP. The complete oxidation of glucose to CO_2 and water releases 685.5 kilocalories of energy. The ADP system traps 266 (38 x 7) kilocalories of this energy, resulting in a possible storage of 39% (266/685) of the energy in the form of ATP.



ENZYME KEY

- *A* = phosphorylase
- *B* = amylase
- *C* = galactowaldenase
- *D* = galactokinase
- *E* = phosphoglucomutase
- *F* = hexokinase
- *G* = phosphatase
- *H* = phosphomannose isomerase
- *I* = mannokinase (hexokinase)
- *J* = phosphohexoisomerase
- *K* = phosphofructomutase
- *L* = fructokinase
- *M* = phosphohexokinase
- *N* = aldolase
- *O* = triosphosphate isomerase
- *P* = phosphoglyceraldehyde dehydrogenase
- *Q* = dehydrogenase
- *R* = transphosphorylase (phosphokinase)
- *S* = phosphoglyceromutase
- *T* = enolase
- *U* = lactic acid dehydrogenase
- *V* = carboxylase
- *W* = alcohol dehydrogenase
- CoA = coenzyme A

continued

56. PATHWAYS OF CARBOHYDRATE METABOLISM

/1/ Adenylic acid and PO_4 required for activity in either direction. /2/ Digestion; glycogen and/or starch are hydrolyzed to glucose in intestinal lumen. /3/ Mg^{++} required for this reaction. /4/ Cori ester. /5/ Robison ester. /6/ Hexokinase reaction assumed to be inhibited by growth hormone plus adrenal cortex hormone; inhibition by these substances is blocked by insulin, thus favoring conversion of glucose to glucose-6-phosphate. /7/ The reaction, glycogen to glucose-6-PO_4 to blood glucose, takes place in liver only; conversion of glucose to glucose-6-PO_4 to glycogen takes place in liver, muscle, and other tissues. /8/ Neuberg ester. /9/ In liver and muscle. /10/ In all tissues. /11/ Hardin-Young ester. /12/ This reaction (to left) causes each step in the conversion to pyruvate to be doubled quantitatively; thus, 1 mole of glucose gives rise to 2 moles of pyruvate. /13/ Hydrogen atoms released. /14/ Hydrogen enters into the reaction. /15/ NAD^+ acts as acceptor of released hydrogen atoms, becoming NADH in oxidative direction of the reaction. NADH gives up hydrogen atoms and becomes NAD^+ in reverse direction. Hydrogen atoms accepted by NAD^+ are passed on in turn to flavoprotein, cytochrome-*c*, cytochrome oxidase, and molecular O_2. If molecular O_2 is not sufficiently available, hydrogen atoms may be passed from NADH to pyruvate-forming lactate. /16/ Inhibited by fluoride. /17/ K^+ also required. /18/ Thiamine pyrophosphate required as coenzyme. /19/ Pyruvate, followed by conversion to lactate when oxygen supply is deficient (*see* Fn. 15), ends glycolysis in animal tissues. If oxygen is available, pyruvate is oxidized via the Krebs cycle. /20/ End of fermentation of plant tissue. /21/ Uridine diphosphate glucose required as coenzyme. /22/ Inhibited by iodoacetate.

57. PATHWAYS OF AMINO ACID METABOLISM

	Amino Acid	Product of Oxidative Deamination or Transamination	Product of Decarboxylation	Pathways and Products of Metabolism
	(A)	(B)	(C)	(D)
1	L-Alanine	Pyruvic acid		
2	L-Arginine	α-Keto-δ-guanidovaleric acid	Agmatine	Arginine → ornithine + urea; arginine → citrulline + NH_3; arginine → agmatine + CO_2; arginine + glycine ⇄ guanidoacetic acid + ornithine.
3	L-Asparagine	α-Ketosuccinamic acid		Asparagine ⇄ aspartic acid + NH_3; asparagine → α-ketosuccinamic acid → NH_3 + oxalacetic acid.
4	L-Aspartic acid	Oxalacetic acid	α-Alanine, β-alanine	Aspartic acid + carbamylphosphate → $PO_4^{\equiv}$ + carbamylaspartic acid → pyrimidines; aspartic acid ⇄ fumaric acid + NH_3; aspartic acid ⇄ homoserine ↗ threonine → isoleucine ↘ methionine
5	L-Citrulline	α-Keto-δ-carbamidovaleric acid		Citrulline + aspartic acid + ATP → AMP + PP + arginosuccinic acid ⇄ arginine + fumaric acid; citrulline + $PO_4^{\equiv}$ ⇄ ornithine + carbamylphosphate; citrulline → carbamylphosphate + ADP ⇄ CO_2 + NH_3 + ATP.
6	L-Cysteine & L-cystine	β-Mercaptopyruvic acid		Cysteine → β-mercaptopyruvic acid → pyruvic acid + S; cysteine → H_2S + NH_3 + pyruvic acid; cysteine → cysteine sulfinic acid → (i) cysteic acid → taurine, (ii) hypotaurine, or (iii) via transamination → β-sulfinylpyruvate → pyruvate + SO_3. (2 cysteine ⇄ cystine)
7	L-Glutamic acid	α-Ketoglutaric acid	γ-Aminobutyric acid	Glutamic acid → γ-aminobutyric acid + CO_2. *See also* ornithine, proline, histidine, glutamine.
8	L-Glutamine	α-Ketoglutaramic acid		Glutamine ⇄ glutamic acid + NH_3; glutamine → α-ketoglutaramic acid → NH_3 + α-ketoglutaric acid.

57. PATHWAYS OF AMINO ACID METABOLISM

	Amino Acid	Product of Oxidative Deamination or Transamination	Product of Decarboxylation	Pathways and Products of Metabolism
	(A)	(B)	(C)	(D)
9	Glycine	Glyoxylic acid		Glycine + N^{5-10}-methenyl-tetrahydrofolate ⇄ serine + tetrahydrofolate; glycine → glyoxylic acid → formate + CO_2; glycine + succinyl-CoA → δ-aminolevulinate → porphyrins; glycine + 5'-phospho-β-D-ribosamine → purines.
10	L-Histidine	β-Imidazolepyruvic acid	Histamine	Histidine → urocanic acid → glutamic acid + NH_3 + formate; histidine → carnosine; histidine → anserine; histidine → histamine → imidazoleacetic acid → NH_3 + formylaspartic acid.
11	L-Hydroxyproline	α-Keto-γ-hydroxy-δ-aminovaleric acid		Hydroxyproline → Δ^1-proline-4-hydroxy-2-carboxylate → pyrrole-2-carboxylate; hydroxyproline → glutamate.
12	L-Isoleucine	*d*-α-Keto-β-methylvaleric acid		Isoleucine → α-keto-β-methylvaleric acid → CO_2 + α-methylbutyryl-CoA ⇄ tiglyl-CoA ⇄ α-methyl-β-hydroxybutyryl-CoA ⇄ α-methyl acetoacetyl-CoA ⇄ acetyl-CoA + propionyl-CoA.
13	L-Leucine	α-Ketoisocaproic acid		Leucine → α-ketoisocaproic acid → CO_2 + isovaleryl-CoA ⇄ senecioyl-CoA + CO_2 ⇄ β-methylglutaconyl-CoA ⇄ β-hydroxy-β-methyl glutaryl-CoA ⇄ acetoacetic acid + acetyl-CoA.
14	L-Lysine	α-Keto-ε-aminocaproic acid	Cadaverine	Lysine → α-keto-ε-aminocaproic acid → Δ^1-piperidine-2-carboxylic acid → pipecolic acid → Δ^6-piperidine-2-carboxylic acid → α-aminoadipic-ε-semialdehyde → L-α-aminoadipic acid → α-ketoadipic acid → glutamic acid → α-ketoglutaric acid → L-glutamic acid.
15	L-Methionine	α-Keto-γ-methiolbutyric acid		Methionine → labile CH_3 + homocysteine → (i) homocysteic acid, (ii) H_2S + NH_3 + α-ketobutyric acid, or (iii) serine → cystathionine → cysteine + NH_3 → α-ketobutyric acid.
16	L-Ornithine	Glutamic-γ-semialdehyde, or α-keto-δ-aminovaleric acid	Putrescine	Ornithine ⇄ proline; ornithine ⇄ glutamic acid; ornithine + carbamylphosphate → citrulline. *See also* citrulline.
17	L-Phenylalanine	Phenylpyruvic acid	Phenylethylamine	Phenylalanine → tyrosine; phenylalanine → phenylpyruvic acid → phenylacetic and phenyllactic acids.
18	L-Proline	Glutamic-γ-semialdehyde, or α-keto-δ-aminovaleric acid		Proline ⇄ ornithine; proline ⇄ glutamic acid; proline → hydroxyproline.
19	L-Serine	β-Hydroxypyruvic acid	Ethanolamine	Serine → NH_3 + H_2O + pyruvic acid; serine + indole-3-glycerol phosphate ⇄ tryptophan. *See also* glycine.
20	L-Threonine	*d*-α-Keto-β-hydroxybutyric acid		Threonine → NH_3 + H_2O + α-ketobutyric acid; threonine → glycine + acetaldehyde; threonine → α-keto-β-hydroxybutyric acid; threonine → aminoacetone. *See also* aspartic acid.
21	L-Tryptophan	β-Indolepyruvic acid	Tryptamine	Tryptophan → formylkynurenine → formate + kynurenine → (i) kynurenic acid, (ii) anthranilic acid + alanine, or (iii) 3-hydroxykynurenine → 3-hydroxyanthranilic acid → 2-acroleyl-3-aminofumaric acid → quinolinic acid → nicotinic acid ribonucleotide; tryptophan → 5-hydroxytryptophan → 5-hydroxytryptamine → 5-hydroxyindoleacetic acid.
22	L-Tyrosine	*p*-Hydroxyphenylpyruvic acid	Tyramine	Tyrosine → *p*-hydroxyphenylpyruvic acid → CO_2 + homogentisic acid + maleylacetoacetic acid → fumarylacetoacetic acid → fumaric acid + acetoacetic acid.
23	L-Valine	α-Ketoisovaleric acid		Valine → α-ketoisovaleric acid → CO_2 + isobutyryl-CoA ⇄ methacrylyl-CoA ⇄ β-hydroxybutyryl-CoA ⇄ β-hydroxyisobutyric acid ⇄ methylmalonic acid semialdehyde ⇄ β-aminoisobutyric acid.

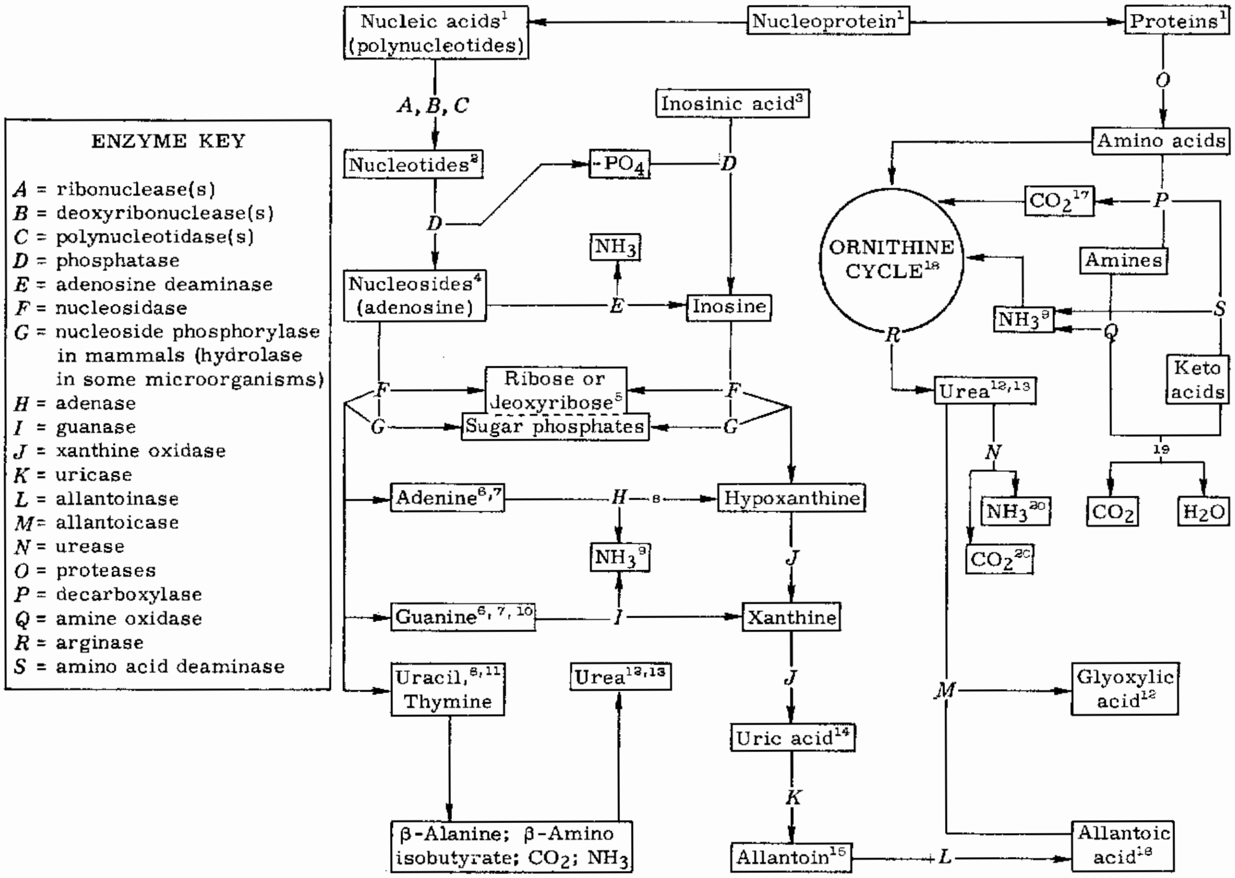
58. PATHWAYS OF NUCLEOPROTEIN CATABOLISM

See Table 59 for detailed pathways of purine and pyrimidine nucleotide catabolism.



/1/ Catabolism of nucleoprotein, nucleic acid, and protein may take place in the alimentary canal or in the tissues. /2/ Little intestinal absorption. /3/ In the biosynthesis of nucleotides, inosinic acid is the precursor of adenylic and guanylic acids; in uricotelic species, a portion is a direct precursor of uric acid. /4/ Absorbed from the intestine. Purine nucleosides are split into purines and pentoses by purine nucleosidase present in tissues. /5/ D-Ribose and D-2-deoxyribose are the sugars typical of the two types of nucleic acids. /6/ Mammals do not require but can synthesize exogenous purines or pyrimidines from products of protein metabolism. /7/ Adenine and guanine are the major purines occurring in nucleic acids. /8/ The route adenine → hypoxanthine is of no importance in animals. Adenase is not found to any extent in mammals. /9/ NH_3, as in the case of CO_2, is also used to synthesize many tissue constituents; hence, it may enter into metabolic processes, be built into amino acids, incorporated into urea and excreted, or excreted as NH_3 across the kidney tubule. /10/ Excreted by pig and spider. /11/ Cytosine is converted to uracil at the nucleotide stage. Free cytosine is excreted unchanged. /12/ Excreted by most fishes, amphibians, and freshwater lamellibranchs. /13/ Excreted by mammals as the end product of amino acid metabolism. Excreted by some animals as the end product of purine and pyrimidine metabolism. /14/ Excreted by primates, some reptiles, and some insects as the end product of purine catabolism. Excreted by birds as the end product of protein, purine, and pyrimidine catabolism; no urea formation by birds. /15/ Excreted by most mammals, gastropods, and some insects. /16/ Excreted by some teleost fishes. /17/ May enter into metabolic processes, into the ornithine cycle and be incorporated into and excreted as urea, or be excreted as CO_2. /18/ Urea formation in mammalian liver occurs via the ornithine cycle (Krebs-Henseleit cycle): ornithine → citrulline → arginine succinate → arginine → ornithine. CO_2 and NH_3 enter the cycle via carbamyl glutamic acid at ornithine; NH_3 enters the cycle via aspartic acid at citrulline. Arginine succinate is split to arginine and fumaric acid; arginine is then converted to ornithine with the release of urea. /19/ Via Krebs cycle. In the course of amino acid metabolism, prior to entry into the Krebs cycle, sulfur-containing amino acids lose their sulfur--usually in the form of SO_4. /20/ Crustacea, gephyrean worms, and marine lamellibranchs do not excrete urea but break it down to, and excrete it as, CO_2 and NH_3.

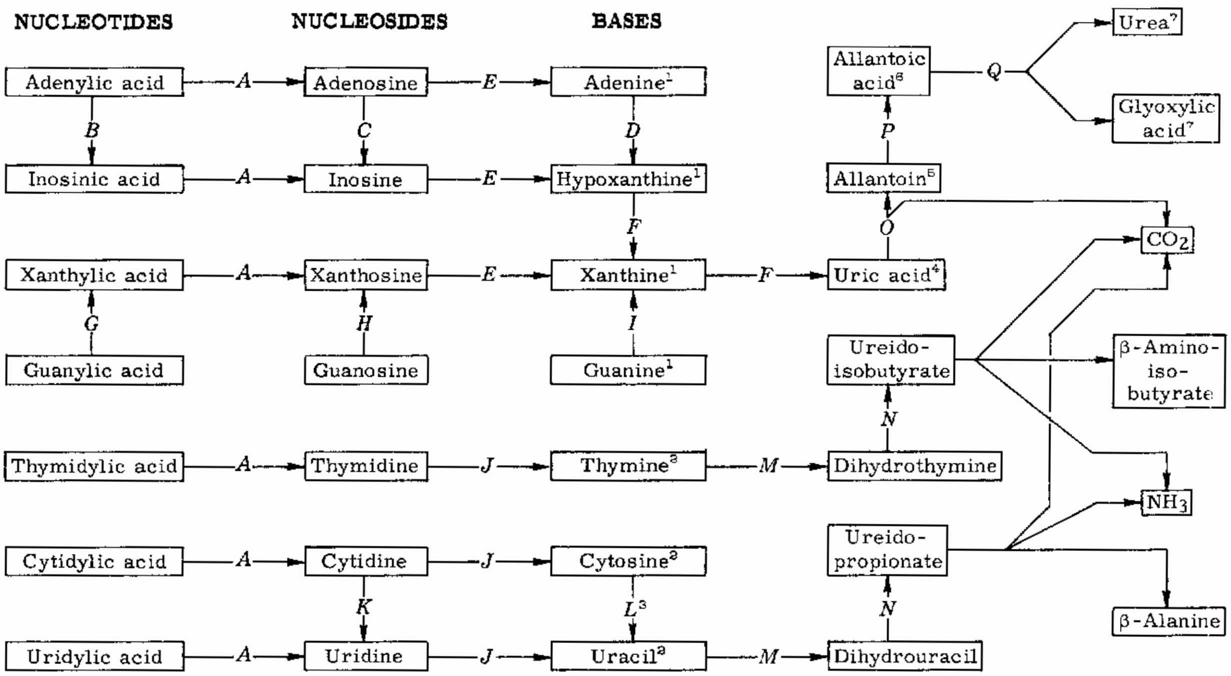
59. PATHWAYS OF PURINE AND PYRIMIDINE CATABOLISM

Nucleoproteins (*see* Table 58) generally are composed of basic proteins (histones or protamines) associated with nucleic acids. The nucleic acids are complex molecules (each composed of many nucleotide units) joined by phosphate sugar linkage. The nucleotides shown below are obtained by enzymic hydrolysis of nucleic acids, although several may be obtained from other sources. Each nucleotide is composed of a purine or pyrimidine base linked to a pentose sugar which, in turn, is linked to phosphate. In catabolism, the phosphate is removed by a nucleotide phosphatase to yield inorganic phosphate and a nucleoside; the nucleoside is cleaved by a nucleoside phosphorylase to give the free base plus ribose-1-phosphate. Also, as a catabolic step, hydrolytic deamination may occur at any level, although it is most frequent at the nucleoside level.

ENZYME KEY

A = phosphatase	*G* = guanylate deaminase	*M* = dihydropyrimidine dehydrogenase
B = adenylate deaminase	*H* = guanosine deaminase	*N* = dihydropyrimidine hydrase
C = adenosine deaminase	*I* = guanase	*O* = uricase
D = adenase	*J* = phosphorylase or hydrolase	*P* = allantoinase
E = nucleoside phosphorylase	*K* = cytidine deaminase	*Q* = allantoicase
F = xanthine oxidase	*L* = cytosine deaminase	



/1/ Purine. /2/ Pyrimidine. /3/ Demonstrated in yeast and *Escherichia coli*. /4/ End product of primates, birds, terrestrial reptiles, and most insects. /5/ End product of mammals other than primates. /6/ End product of some teleost fishes. /7/ End product of most fishes, amphibians, and freshwater lamellibranchs.

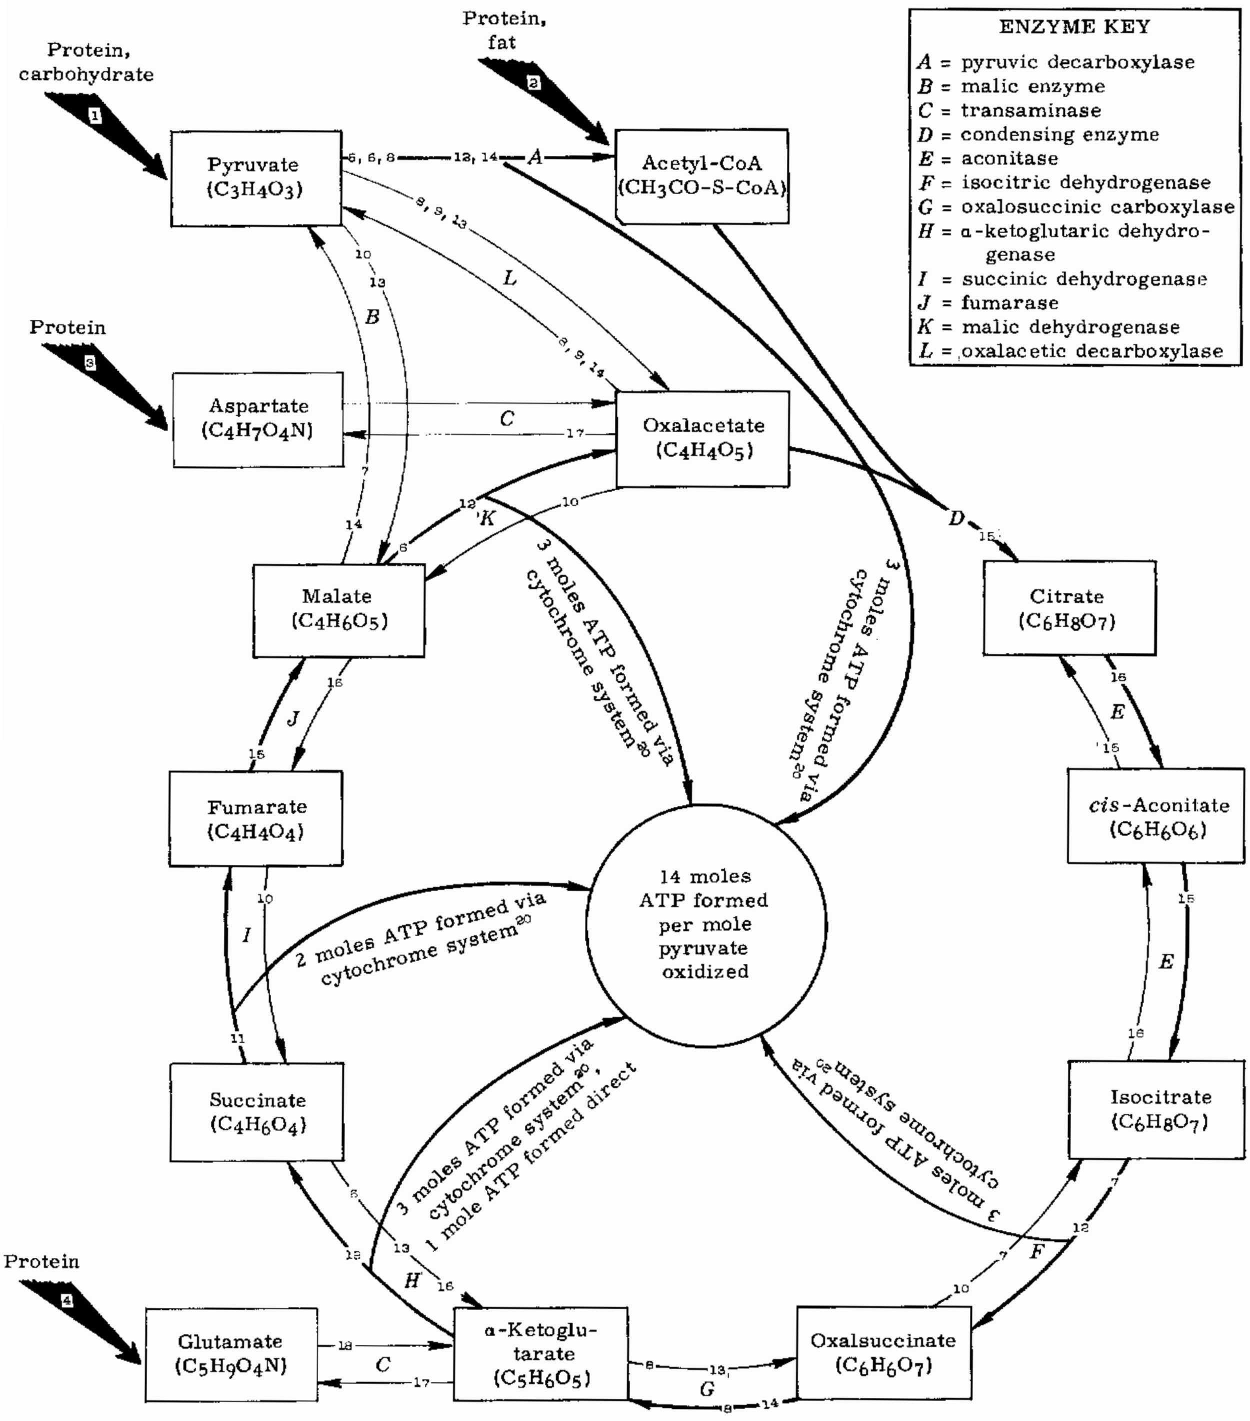
61. KREBS CYCLE

The Krebs cycle (tricarboxylic acid cycle) is a major pathway for the final aerobic oxidation of carbohydrates, fats, and proteins, which are channeled into the cycle via their two key metabolites, pyruvate and acetyl-CoA (active acetate). Each "revolution" of the cycle oxidizes acetate to CO_2 and H_2O. One mole (59 g) of acetate thus oxidized releases approximately 200 kilocalories of energy. A portion of the released energy (approximately 144 kilocalories) enters the phosphate pool as ATP. Twelve moles of ATP are formed from ADP and PO_4 (by energizing PO_4 to $-PO_4$). The remainder of the released energy appears as heat. Oxidation of 1 mole (87 g) of pyruvate, via acetyl-CoA, contributes a total of 14 moles of ATP to the energy pool. Heavy lines indicate main sequence of reactions.



continued

61. KREBS CYCLE

/1/ Glucogenic amino acid precursors for pyruvate are alanine, glycine, serine, threonine, methionine, cysteine, valine. /2/ Ketogenic amino acid precursors for acetyl-CoA are leucine, isoleucine, phenylalanine, tyrosine. /3/ Aspartic acid occurs as a component of protein. /4/ Glutamic acid occurs as a component of protein or may be formed from arginine, proline, hydroxyproline, histidine, ornithine. /5/ Coenzyme A (ATP-pantoyl-β-alanyl-thioethanolamine) and α-lipoic acid required. /6/ In the oxidative direction, NAD^+ (nicotinamide adenine dinucleotide) acts as hydrogen acceptor; in the reverse direction, NADH is hydrogen donor. /7/ In the oxidative direction, $NADP^+$ (nicotinamide adenine dinucleotide phosphate) acts as hydrogen acceptor; in the reverse direction, NADPH is hydrogen donor. /8/ Cocarboxylase (thiamine pyrophosphate) required as coenzyme for the carboxylase *(A)*; also Mg^{++} or Mn^{++} required as activator for the enzyme. /9/ Biotin required as coenzyme for decarboxylation. /10/ Two moles of hydrogen enter into the reaction. /11/ Two moles of hydrogen released and their electrons transferred to cytochrome. /12/ Hydrogen atoms transferred to NAD^+ (or, in the case of isocitrate → oxalsuccinate, to $NADP^+$) and pass in turn to flavoprotein, cytochrome-*c*, cytochrome oxidase, and finally to combination with molecular oxygen. For each mole of hydrogen thus passed and finally oxidized, 1.5 moles of ATP are formed by the addition of energized phosphate ($-PO_4$) to ADP. /13/ CO_2 enters into the reaction. /14/ CO_2 released. /15/ H_2O enters into the reaction. /16/ H_2O released. /17/ NH_3 enters into the reaction by transamination. /18/ NH_3 transferred from glutamate by transamination, then enters into Krebs cycle via α-ketoglutarate. /19/ Footnotes 5, 6, 8, 12, 14 apply to this reaction. /20/ For details, *see* Table 62 on the cytochrome system.

62. CYTOCHROME SYSTEM

The cytochromes (iron-containing compounds) in association with certain enzymes comprise the cytochrome system. The system operates as the final pathway by which an intermediate metabolite (substrate), under the influence of its specific dehydrogenase, releases hydrogen to the first member in a series of carriers for ultimate combination with oxygen to form water. Each step in the process involves both oxidation and reduction: the cytochrome system oxidizes the hydrogen of the substrate by removing electrons from it, thereby producing oxidized substrate and hydrogen ions. The system itself is reduced in the process and is finally oxidized by molecular oxygen. For each gram of hydrogen thus passed to NADH and finally oxidized, enough energy is produced to form 1.5 moles of ATP from ADP and PO_4.

63. PROPERTIES OF CYTOCHROMES: ANIMALS AND HIGHER PLANTS

The cytochromes of animals and higher plants are intracellular chromoproteins which are entirely associated with lipoprotein structural elements of cytoplasm. The prosthetic group contains coordinated iron which may undergo alternate oxidation and reduction. **Physical and Chemical Properties** (column C): PG = prosthetic group; MW = molecular weight; E'_0 = oxidation-reduction potential. **Spectral Characteristics** (columns D and E): λ maximum in mμ = wave length of maximum absorption; figures in parentheses are $E^{mM}_{1\,cm}$, i.e., extinction coefficients of millimolar solutions of 1-cm thickness.

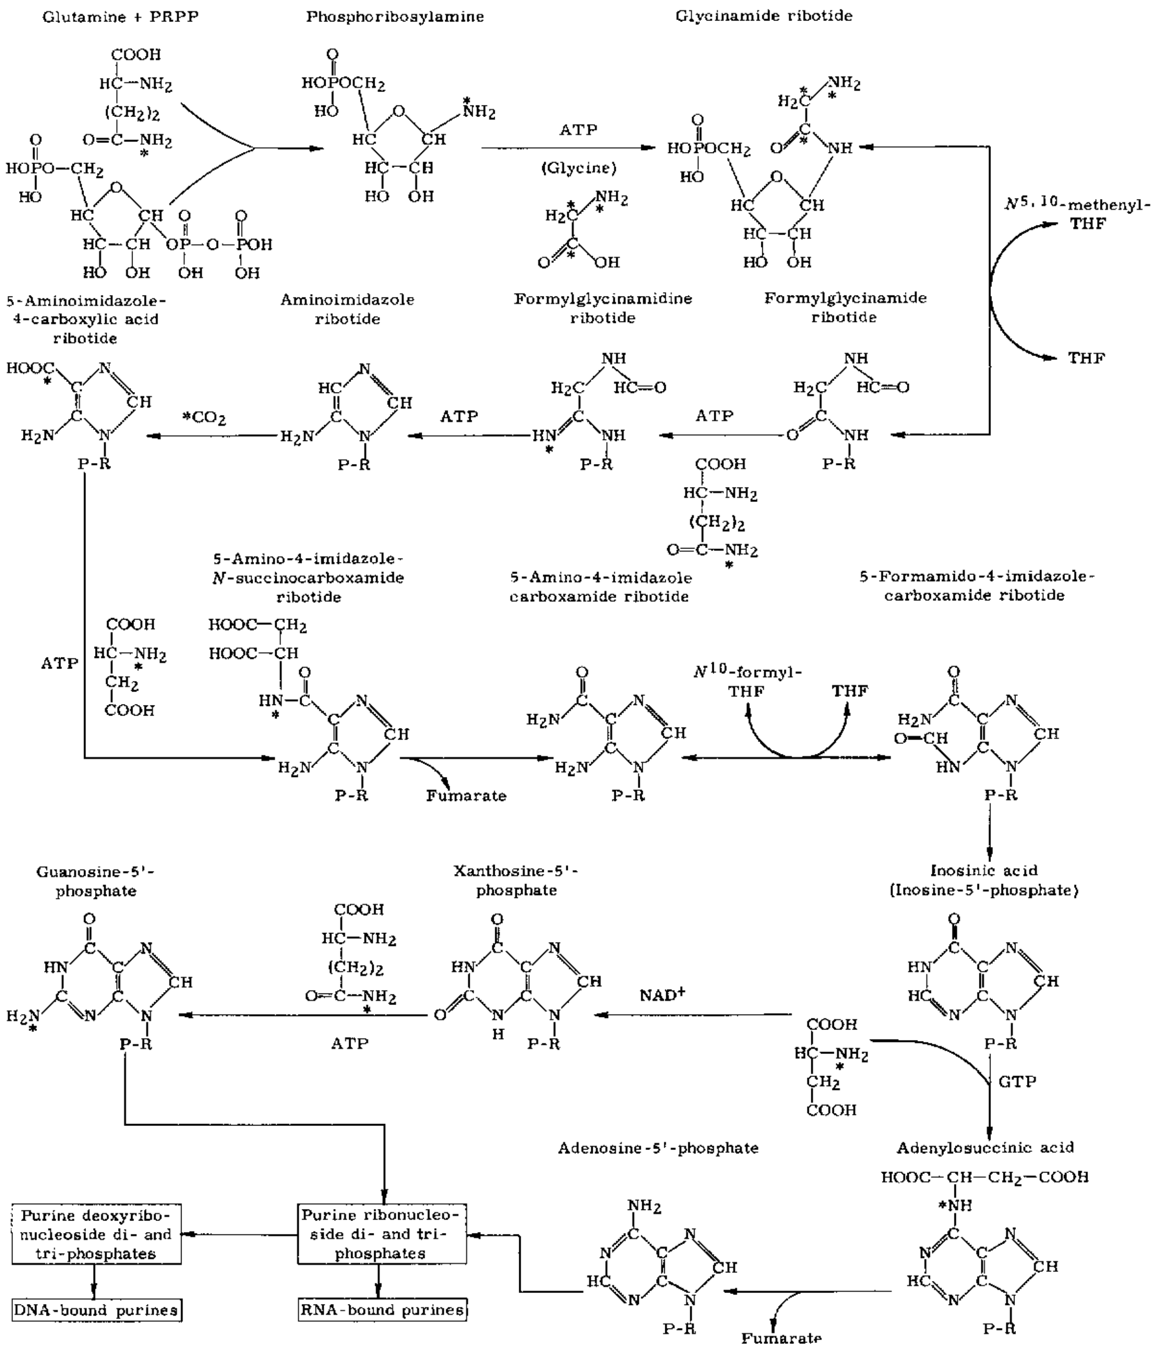
64. PATHWAYS OF BIOSYNTHESIS: PURINES

* = isotopically labeled atom incorporated into next product.

ENZYME KEY

ATP = adenosine triphosphate	GTP = guanosine triphosphate
NAD^+ = nicotinamide adenine dinucleotide (oxidized form)	PRPP = phosphoribosylpyrophosphate
P-R = ribosyl-5'-phosphate	THF = tetrahydrofolic acid coenzyme

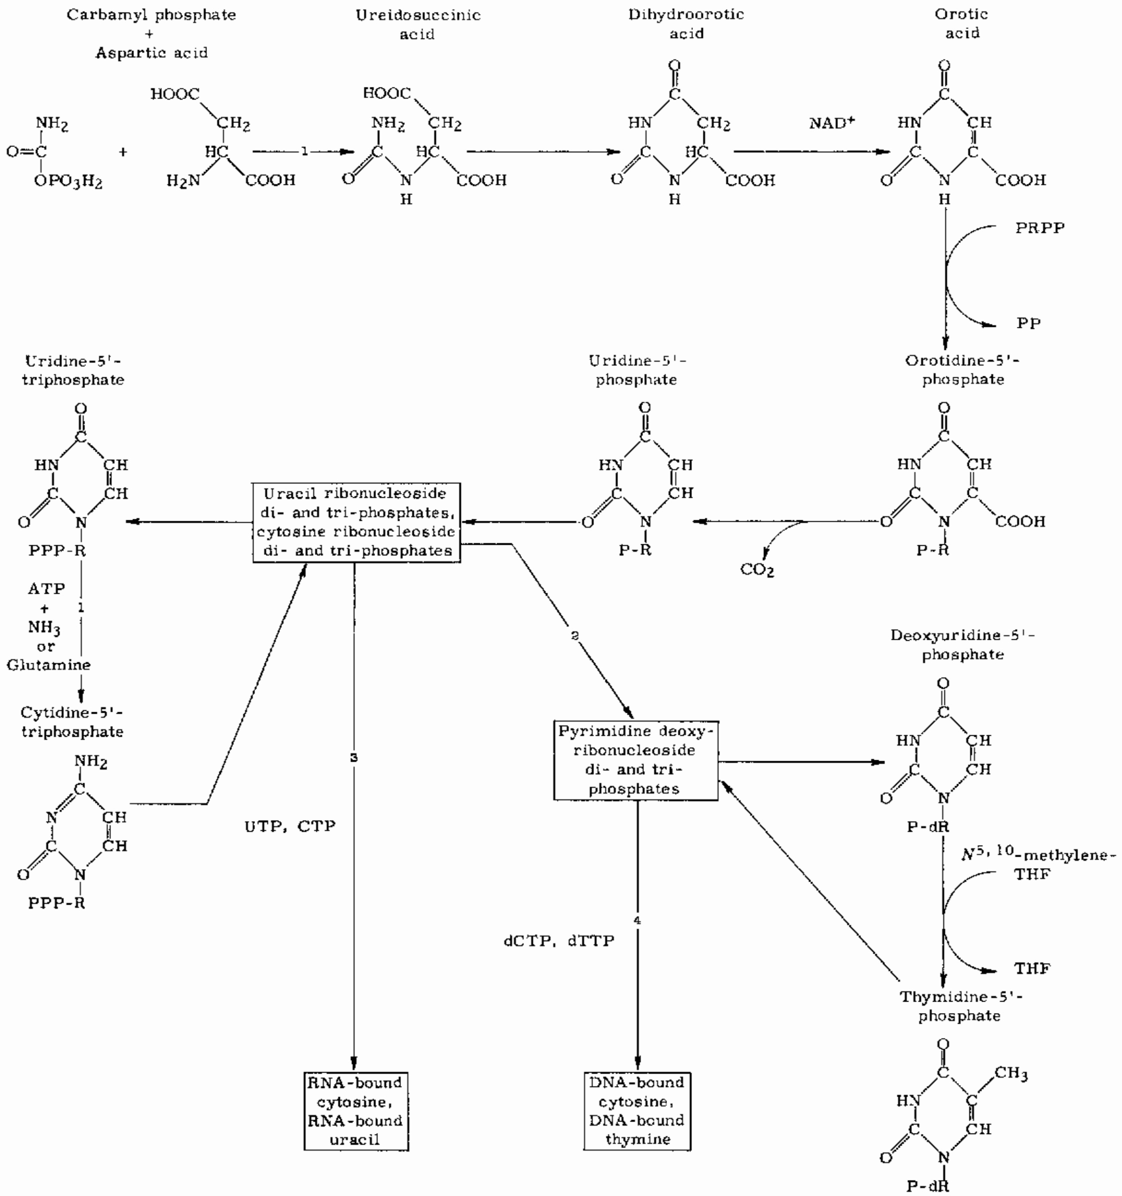


Contributors: Lansford, Edwin M., Jr., and Shive, William

References: [1] Buchanan, J. M., et al. 1959. J. Cellular Comp. Physiol. 54:139. [2] Hartman, S. C., and J. M. Buchanan. 1959. Ann. Rev. Biochem. 28:365. [3] White, A., et al. 1959. Principles of biochemistry. Ed. 2. McGraw-Hill, New York. p. 582.

ENZYME KEY

ATP = adenosine triphosphate	PP = inorganic pyrophosphate
CTP = cytidine triphosphate	PRPP = phosphoribosylpyrophosphate
dCTP = deoxycytidine triphosphate	P-R = 5'-ribosylphosphate
UTP = uridine triphosphate	PPP-R = 5'-ribosyltriphosphate
dTTP = deoxythymidine triphosphate	P-dR = 5'-deoxyribosulphosphate
NAD^+ = nicotinamide adenine dinucleotide	THF = tetrahydrofolate coenzyme



/1/ The mechanism for this reaction varies slightly with the enzyme source (animal or microbial). /2/ One or more enzymic reactions not yet fully elucidated. /3/ Reaction catalyzed by RNA polymerase. /4/ Reaction catalyzed by DNA polymerase.

Contributors: Lansford, Edwin M., Jr., and Shive, William

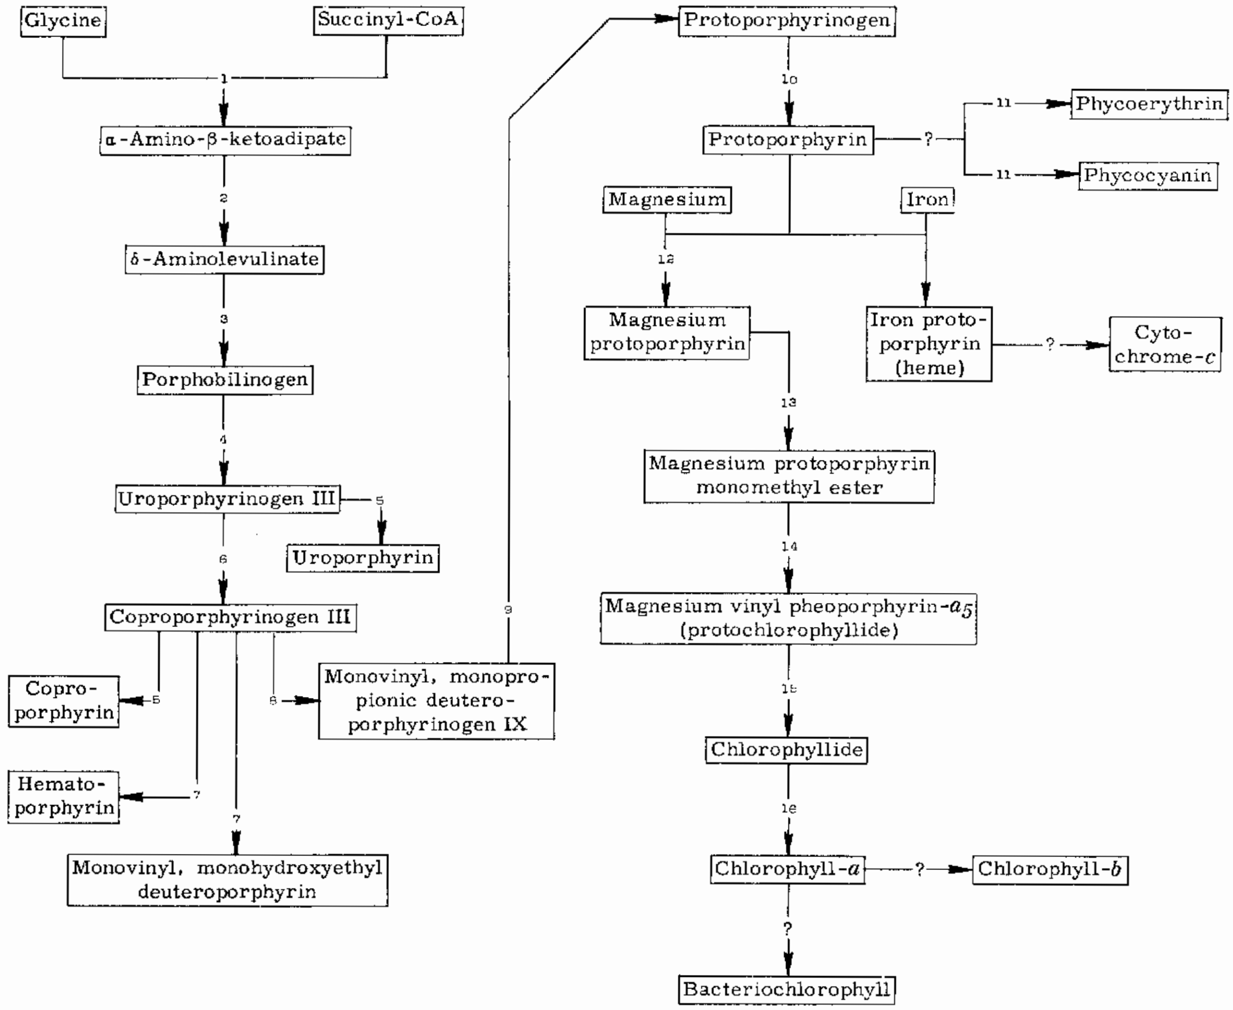
66. PATHWAYS OF BIOSYNTHESIS: CHLOROPHYLL

Diagram summarizes present knowledge of the pathways leading to synthesis of chlorophyll in plants.



/1/ Condensation of glycine with succinyl-CoA produces α-amino-β-ketoadipate. /2/ Decarboxylates to δ-aminolevulinate. /3/ Two molecules of δ-aminolevulinate are condensed by a dehydrase enzyme, forming the pyrrole amine, porphobilinogen. /4/ Four molecules of porphobilinogen are condensed, forming a reduced porphyrin, uroporphyrinogen III. /5/ Autoxidation products found in congenital porphyria. /6/ Decarboxylation of uroporphyrinogen III to coproporphyrinogen III. /7/ Side products found in a *Chlorella* mutant. /8/ Oxidation of one propionic side chain to vinyl. /9/ Oxidation of one propionic side chain to vinyl, producing protoporphyrinogen. /10/ Autoxidation to protoporphyrin. /11/ Open-chain bile pigment chemically bound to protein. /12/ Magnesium protoporphyrin found in a *Chlorella* mutant. /13/ Found in a *Chlorella* mutant and etiolated barley. /14/ Three or four steps postulated, including reduction of a vinyl side chain to ethyl, oxidation of a propionic acid group and cyclization to a cyclopentanone ring. Found in a *Chlorella* mutant. /15/ Addition of two hydrogen atoms on pyrrole ring D of protochlorophyllide. /16/ Esterification of a propionic acid group with phytol, a C-20 alcohol.

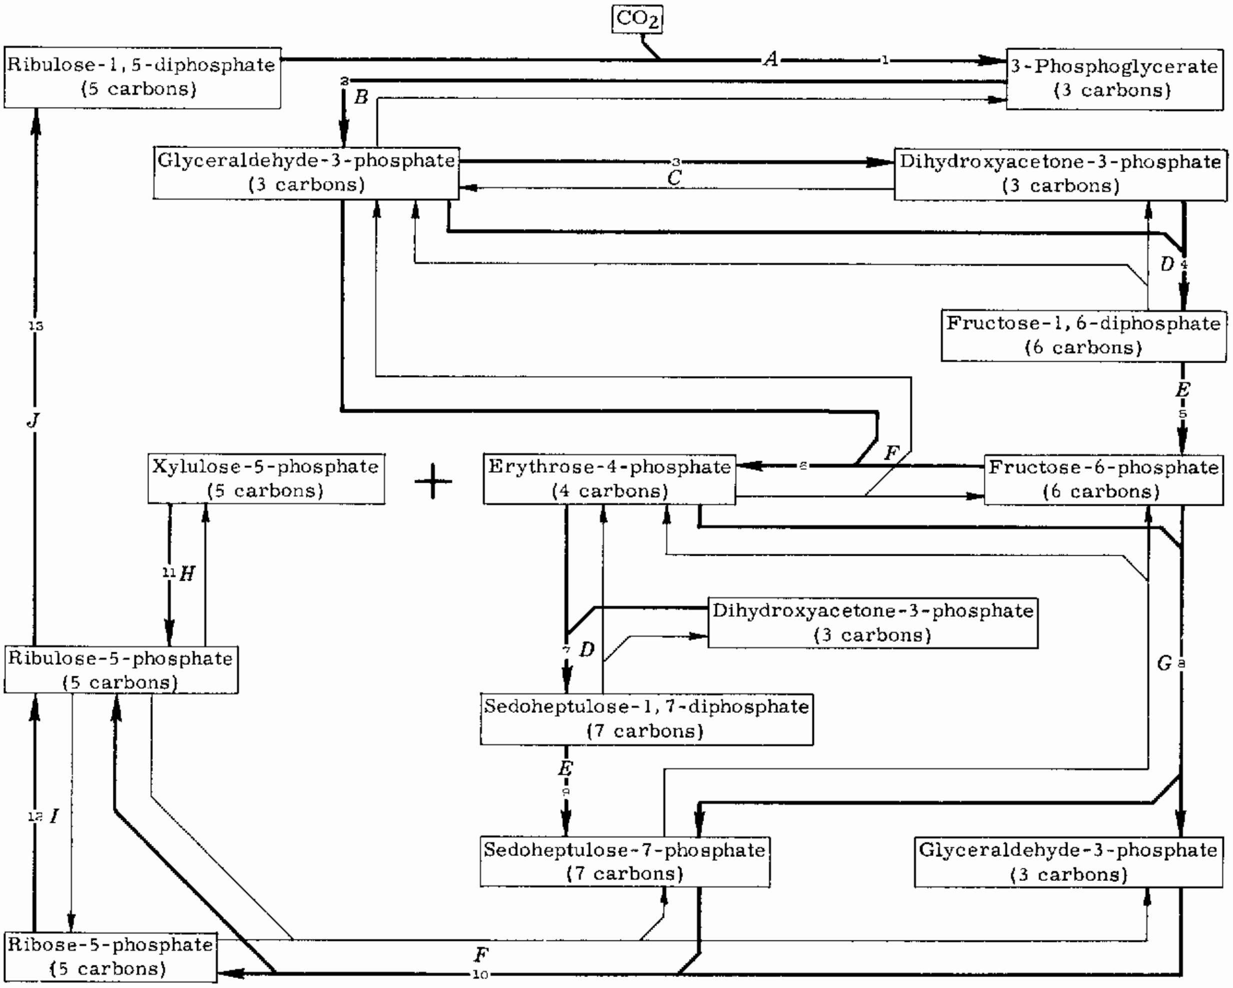
67. PATHWAYS OF PHOTOSYNTHESIS: CARBON DIOXIDE REDUCTION CYCLE

According to current evidence, photosynthetic carbon dioxide reduction follows the same general pathways in all plants. The first reaction results in formation of two molecules of phosphoglycerate from carbon dioxide and ribulose diphosphate. Phosphoglycerate is then reduced via the reverse of glycolysis (indicated by light arrows) to supply hexose phosphates for synthesis of sucrose and polysaccharides. A portion of the intermediate compounds goes through the sequence of reactions shown in the diagram, leading to regeneration of the carbon dioxide acceptor, ribulose diphosphate. It is not known whether one or both of the pathways to sedoheptulose phosphate (step 8 and steps 7 and 9) are important in carbon reduction during photosynthesis. Heavy arrows indicate directions of material transfer during steady state photosynthesis.

ENZYME KEY

A = ribulose diphosphate carboxylase (carboxydismutase)	*D* = aldolase	*H* = phosphoketopentose epimerase
B = triosephosphate dehydrogenase	*E* = phosphatase	*I* = phosphoriboisomerase
C = triosephosphate isomerase	*F* = transketolase	*J* = phosphoribulokinase
	G = transaldolase	



/1/ Ribulose diphosphate adds CO_2 at carbon-2 and splits hydrolytically to give two molecules of 3-phosphoglycerate. /2/ The carboxyl group is reduced to an aldehyde group with the aid of ATP and NADPH. /3/ Isomerization involves transfer of two hydrogen atoms from carbon-2 to carbon-1. /4/ Aldol condensation of carbon-1 of glyceraldehyde-3-P with carbon-1 of dihydroxyacetone-3-P. /5/ Removal of the phosphate ester group from carbon-1 by hydrolysis. /6/ Two hydrogen atoms plus the glycolyl group (carbon-1, 2) of fructose transferred to glyceraldehyde-P to form xylulose-5-P, leaving erythrose-P. /7/ Aldol condensation of carbon-1 of erythrose-4-P with carbon-1 of dihydroxyacetone-3-P obtained from step 3. /8/ Transfer of triose group (carbon-1, 2, 3) from fructose-6-P to carbon-1 of erythrose-4-P, leaving glyceraldehyde-3-P from carbon-4, 5, 6 of the fructose-6-P. /9/ Hydrolysis of the phosphate ester group on carbon-1 to give inorganic phosphate. /10/ Transfer of the glycolyl group (carbon-1, 2) of sedoheptulose-7-P to carbon-1 of glyceraldehyde-3-P to give ribulose-5-P, leaving ribose-5-P. /11/ Epimerization of carbon-3 of ketopentose. Xylulose-5-P isomerizes to ribulose-5-P with phosphoketopentose epimerase. /12/ Isomerization of aldose to ketose by the transfer of two hydrogen atoms. /13/ Phosphorylation of carbon-1 by reaction with ATP.

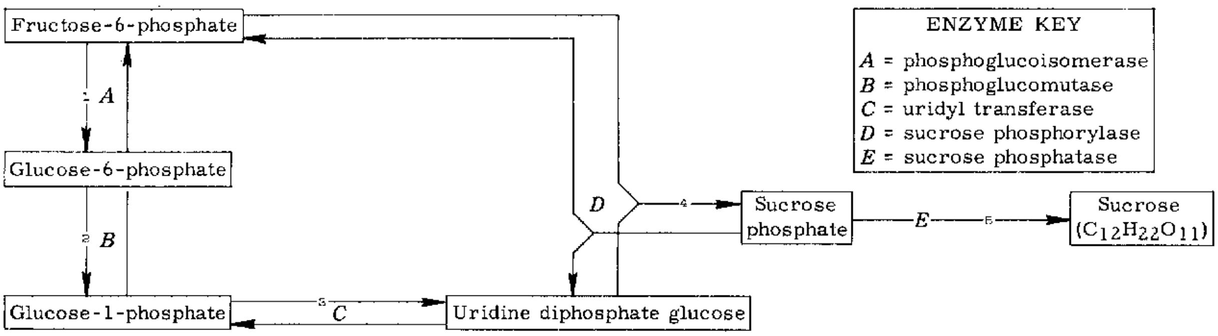
68. PATHWAYS OF SUCROSE SYNTHESIS: INTERMEDIATES

Sucrose, common to all green plants, is the first free sugar formed by a series of steps involving phosphorylated intermediates. Photosynthesis supplies reduced pyridine nucleotides and adenosine triphosphate (ATP). Phosphoglycerate, provided by the photosynthetic carboxylation reaction, is reduced and condensed to form hexose molecules. Energy required to produce sucrose from hexose phosphates comes largely from high-energy uridine triphosphate (UTP) which becomes uridine diphosphate glucose (UDP-glucose) for condensation with fructose phosphate.



/1/ Hydrogen atom on carbon-1 shifts to carbon-2, forming the epimer, glucose-6-phosphate; furanose ring structure is changed to pyranose. /2/ Phosphate group on carbon-6 is transferred to carbon-1 through the required coenzyme intermediate, glucose-1,6-diphosphate; Mg^{++} is required. /3/ UTP reacts with glucose-1-phosphate to form pyrophosphate and UDP-glucose. /4/ Fructose-6-phosphate and UDP-glucose react to give UDP and an unstable sucrose phosphate. /5/ Hydrolysis occurs to give free sucrose and orthophosphate.

VII. RESPIRATION AND CIRCULATION

73. CHARACTERISTICS OF RESPIRATORY MEDIA

Water and nitrogen are the two major ecological variations in the respiratory media available to organisms. The aqueous or gaseous solvent (water or nitrogen), through which the exchange of O_2 and CO_2 occurs, is the primary substance that actively ventilates the respiratory organ. The solvent is mechanically inspired by the animal. STP = standard temperature and pressure.

	Variable	Media			
		Aquatic		Atmospheric	
		Ocean	Fresh	Sea Level	6,000 Meters

75. OXYGEN CONSUMPTION

Oxygen consumption values should be used with caution, as the figures reflect order of magnitude only.

Part I. MAMMALS

Values are cubic millimeters oxygen per gram fresh weight per hour for adult animals.

	Species	Common Name	Rate	Reference		Species	Common Name	Rate	Reference
	(A)	(B)	(C)	(D)		(A)	(B)	(C)	(D)
1	*Homo sapiens*	Man	220[1]	2	14	*Mus musculus*	House mouse	3,500[1]	8
2			4,000[2]	10	15			1,530[6]	7
3	*Bos taurus*	Cattle, ♀	184	2	16	*Mustela rixosa*	Least weasel	5,000	13
4			390	3,14	17	*Myotis lucifugus*	Little brown bat	1,500	8

76. RESPIRATION RATES

Part I. BACTERIA

Rate and degree of respiration may be affected by numerous factors, such as strain characteristics, composition of growth medium, age and number of cells in an inoculum, origin of inoculum, ages of culture harvested for study, nature of solution used for washing, number of washings, and composition of the respiratory system. Data are for bacterial suspensions in the presence of glucose.

	Species	Temp. °C	Culture Age hr	Q_{O_2} µl/mg dry wt/hr	Reference

77. HEART RATES

Heart rate varies with species, sex, age, size, environment, and temperature. Values in parentheses are ranges, estimate "c" (cf. Introduction).

Part I. MAN

	Specification	Heart Rate beats/min	Reference
	(A)	(B)	(C)
	Embryo		1
1	5th mo	156(150-160)	
2	6th mo	154(141-155)	
3	7th mo	149(118-156)	
4	8th mo	142(129-152)	
5	9th mo	146(131-173)	
6	Premature	145(110-185)	6
7	Newborn	134(101-160)	5
8	1 yr	111(84-136)	5
9	2 yr	108(84-134)	5
10	4 yr	103(80-133)	5
11	5-9 yr	96(68-128)	3
12	10-14 yr	87(56-120)	3
13	15-19 yr	79(52-112)	3
14	20-24 yr	74(41-100)	3
15	25-30 yr	72(52-102)	5
16	30-35 yr	70(58-104)	5
17	35-40 yr	72(56-100)	5
18	40-45 yr	72(50-104)	5
19	45-50 yr	72(49-100)	5
20	50-55 yr	72(52-94)	5
21	55-60 yr	75(48-108)	5
22	60-65 yr	73(54-100)	5
23	65-70 yr	75(52-96)	5
24	70-75 yr	75(54-104)	5
25	75-80 yr	72(50-94)	5
26	>80 yr	77(63-98)	3
	College students, ♂		4
27	Basal	65(45-105)

79. VASCULAR AND CAPILLARY PRESSURES

Part I. VASCULAR PRESSURES: MAN

Contributors: Terry, Luther L., and Braunwald, Eugene

References: [1] Braunwald, E., et al. 1961. Circulation 24:267. [2] Fowler, N. O., et al. 1953. Am. Heart J. 46:264. [3] Snabel, T. G., Jr., et al. 1954. Penna. Med. J. 57:363. [4] Terry, L. L. Unpublished. Natl. Institutes of Health, Bethesda, Md., 1955.

Part II. RELATIONSHIP OF PERIPHERAL ARTERIAL TO CENTRAL ARTERIAL PRESSURE: MAN

Values are expressed as percent of aorta pressure or of subclavian pressure near the aorta.

	Condition	Artery	Blood Pressure Systolic	Diastolic	Mean
	(A)	(B)	(C)	(D)	(E)
1	Supine,	Brachial	109	96	98
2	at rest	Radial	112	93	94
3		Femoral	110	94	96
4	Supine,	Brachial	111	97	97
5	during	Radial	113	93	93
6	exercise	Femoral	101	95	97
7	70° head-	Brachial	111	98	99
8	up tilt	Radial	115	95	98
9		Femoral	123	98	100

Contributor: Terry, Luther L.

Reference: Kroeker, E. J., and E. H. Wood. 1955. Circulation Res. 3:623.

Part III. VENOUS BLOOD PRESSURE: MAN

Reference level was the phlebostatic axis. Subjects were supine, breathing quietly. Forced respiration (e.g., Valsalva's maneuver) profoundly influences venous pressure. Values in parentheses are ranges, estimate "c" (cf. Introduction).

	Vein	Blood Pressure mm H_2O
	(A)	(B)
	Median basilic vein at elbow	
1	3-5 yr	46(30-63)
2	5-10 yr	58(33-74)
3	Adult ♀	94(60-128)
4	Adult ♂	100(50-140)
5	Femoral	111(98-128)
6	Abdominal	115(70-160)
7	Dorsal metacarpal	130(70-170)
8	Great saphenous at ankle	150(110-190)
9	Dorsal pedal	175(124-210)

Contributor: Terry, Luther L.

Reference: Burch, G. E. 1950. A primer of venous pressure. Lea and Febiger, Philadelphia.

Part IV. CAPILLARY BLOOD PRESSURE: VERTEBRATES

All measurements made directly by microcannulation [1]. **Capillary** (column D): A = arterial; V = venous. Values in parentheses are ranges, estimate "c" (cf. Introduction).

	Tissue	Species (Common Name)	Condition	Capillary	Pressure cm H_2O	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
1	Eponychium (finger)	*Homo sapiens*	Normal	A	43.5(28.6-65.0)/1/	5,7
2		(man)		V	16.5(8.0-24.5)/1/	
3			Hypertension	A	48.5(10.1-95.1)	2
4				V	30.8(12.8-58.0)	
5			Hyperemia	A	86.0(71.0-93.0)	7
6				V	(54.5-66.5)	
7	Mesentery	*Cavia porcellus*	Decerebrate; anesthetized	A	38.5(31.0-49.0)	4,7
8		(guinea pig)	with veronal ether	V	17.0(13.0-19.5)	
9		*Rattus* sp. (rat)	Decerebrate	A	30.0(22.0-34.0)	4,7
10				V	17.0(15.0-20.0)	
11		*Rana* sp. (frog)	Pithed	A	14.4(5.0-22.0)	3,7
12				V	10.1(6.7-18.0)	

/1/ Varies directly with arteriolar vasodilation produced by emotion, heat, or trauma. Varies inversely with arteriolar vasoconstriction produced by emotion or cold. Varies minimally in a single capillary with time, and also from capillary to capillary. Varies directly with venous pressure as affected by hydrostatic pressure or venous obstruction.

VIII. BLOOD

80. BLOOD GROUP SYSTEMS: MAN

The A-B-O, the M-N, and the Rh-Hr are the three most important blood group systems in man and are the ones most used in the study of human linkage, in tests for zygosity of twins, and in medicolegal problems of disputed parentage. Other blood group systems have been reported after an antibody giving reactions unrelated to previously described blood groups has been encountered in the serum of certain individuals (mothers of erythroblastotic babies [Kell, Kidd], patients who had received blood transfusions [Duffy, Lutheran]). The blood group systems in man depend on multiple allelic genes for their hereditary transmission. None of the blood-grouped genes is known to be sex-linked, and the genes of each blood group system appear to be located on different pairs of chromosomes, as is shown by their independent heredity. For information on other blood group systems, consult reference 1, Part I.

Definitions: **agglutinin** = an antibody aggregating a particular antigen; **agglutinogen** = any substance that acts as an antigen and stimulates the production of agglutinin; **antiserum** = a serum containing an antibody or antibodies; **antibody** = a modified serum globulin, synthesized by an animal in response to antigenic stimulus, that reacts specifically in vivo and in vitro with the homologous antigen; **antigen** = a high-molecular-weight substance, or complex, foreign to the blood stream, that, upon gaining access to the tissues of the animal, stimulates the formation of a specific antibody and reacts specifically in vivo or in vitro with the homologous antibody; **blood factors** = the specific serological properties by which an agglutinogen is recognized, e.g., if blood cells are clumped by an antiserum assigned the symbol anti-**X**, they are said to have blood factor **X**; **gene** = the biologic unit of heredity, self-reproducing and located in a definite position (locus) on a particular chromosome; **allelic genes** = genes situated at corresponding loci in a pair of chromosomes; **genotype** = the fundamental hereditary constitution (or assortment of genes) of an individual; **phenotype** = the outward, visible expression of the hereditary constitution of an individual.

Part I. PHENOTYPES AND GENOTYPES OF THE A-B-O SYSTEM

The A-B-O blood groups are determined by two agglutinogens on the red blood cells (agglutinogen A which occurs in two principal forms, A_1 and A_2, and agglutinogen B) and two corresponding, naturally occurring isoagglutinins in the serum (anti-**A** [alpha] and anti-**B** [beta]). The latter are regularly present in the serum when the corresponding agglutinogen is absent from the red cells, except during the neonatal period when the antibody-producing mechanism is immature. Tests include examination of the serum for isoagglutinin content, as well as examination of the reaction of the red cells to anti-**A** and anti-**B** serums. Anti-**A** was obtained from type-B subjects, and anti-**B** from type-A subjects. Frequencies (columns B and I) are for populations of European origin. *Xx* genes (column J) segregate independently of and modify *ABO* genes.

	Phenotype: Designation	Phenotype: Frequency %	Phenotype: Reaction with Anti-: A	Reaction with Anti-: A_1	Reaction with Anti-: B	Reaction with Anti-: H	Phenotype: Plasma Agglutinin	Genotype: ABO Genes	Genotype: Frequency %	Genotype: Xx Genes
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)	(I)	(J)
1	O	45.0	-	-	-	+	Anti-**A**, anti-**B**	*OO*	45.0	*XX* or *Xx*
2	A_1	31.0	+	+	-	-	Anti-**B**, occasionally anti-**H**	A_1A_1	3.5	
3								A_1A_2	2.6	
4								A_1O	25.0	
5	A_2	9.6	+	-	-	+	Anti-**B**, occasionally anti-$\mathbf{A_1}$	A_2A_2	0.5	
6								A_2O	9.2	
7	B	10.0	-	-	+		Anti-**A**	*BB*	0.7	
8								*BO*	9.3	
9	A_1B	2.9	+	+	+	-	Occasionally anti-**H**	A_1B	2.9	
10	A_2B	1.1	+	-	+		Occasionally anti-$\mathbf{A_1}$	A_2B	1.1	
11	"Bombay type"	Rare	-	-	-	-	Anti-**A**, anti-**B** anti-**H**	*A,B,O*[1]	Rare	*xx*

/1/ Probably any combination is possible.

in man. Ed. 3. Blackwell, Oxford. [3] Wiener, A. S., and I. B. Wexler. 1958. Heredity of the blood groups. Grune and Stratton, New York.

Part II. PARTIAL LIST OF ALLELIC GENES OF THE M-N SYSTEM

So far as is known, the M-N phenotype of a person is exactly what would be expected from the genotype, no suppressing effect of any one *M-N* gene on any other having been demonstrated. In blood typing, anti-**M** is obtained from humans or immunized rabbits, anti-**N** from immunized rabbits or from seeds of *Vicia graminea*, anti-**Hu** and anti-**He** are obtained only from immunized rabbits, and other antiserums only from sensitized humans. Blood factor frequencies are for Europeans and are given in parentheses.

	Gene	Gene Frequency %	Reaction with Anti- M (79%)	M^g (Rare)	N (71%)	S (55%)	s (89%)	U (99+%)	Hu (Rare[1])	He (Rare[1])	Mi^a (Rare[1])	Vw (Rare[1])	Vr (Rare[1])
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)
1	*MS*	25	+	-	+[2]	+	-	+	-	±	±	-	-
2	*Ms*	28	+	-	+[2]	-	+	+	-	±	-	-	±
3	MS^u	Rare	+	-	-	-	-	-	-	-	-	-	
4	*NS*	8	-	-	+	+	-	+	-	±	-	-	-
5	*Ns*	39	-	-	+	-	+	+	±	±	±	±	-
6	NS^u	Rare	-	-	+	-	-	-	-	-	-	-	
7	M^g	Rare	-	+		-			-	-	-	-	-
8	*MU*	Rare	+	-	-	-	-	+					
9	*NU*	Rare	-	-	+	-	-	+					

/1/ Factors **Hu**, **He**, **Mi^a**, **Vw**, and **Vr** undoubtedly occur in other combinations than are shown here, but there is, as yet, insufficient information about these factors to prepare a complete table of the *M-N* genes. Other antigenic factors in the MN system are M_1, M^c, M^e, Mu, Mt^a, St^a, Ri^a, Cl^a, and Ny^a. All except M^e are rare. M^e is produced by *M* genes and by genes that produce **He**. /2/ These genes produce a small amount of **N** factor or something which cross-reacts with anti-**N**.

80. BLOOD GROUP SYSTEMS: MAN

Part III. PHENOTYPES AND GENOTYPES OF THE Rh-Hr SYSTEM

The Rh-Hr system is the most complicated of the human blood systems. At the present time, four principal Rh blood factors (**Rh_o**, **rh'**, **rh''**, and **rh^W**) and three principal Hr factors (**hr'**, **hr''**, and **hr**) are recognized. However, antiserums for only five of these seven factors are readily available for routine clinical and medicolegal work (anti-**Rh_o**, anti-**rh'**, anti-**rh''**, anti-**hr'** and anti-**hr''**). The **Rh_o** factor is the most common source of clinical symptoms, as it is the most antigenic of the Rh-Hr factors. It appears to represent a special structure within the Rh-Hr agglutinogen, since red cells can be coated with the **Rh_o**-blocking antibody without interfering with the reactions of the red cells with other antibodies such as anti-**rh'**, anti-**rh''**, anti-**hr'**. Frequencies are for white residents of New York City. Frequencies (columns E and J) are based on estimated gene frequencies: r = 38%; r' = 0.6%; r'' = 0.5%; r^{y} = 0.01%; r'^{w} = 0.005%; R^{o} = 2.7%; R^{1} = 41%; R^{2} = 15%; R^{z} = 0.2%; R^{1w} = 2%.

81. HEREDITY OF BLOOD GROUPS AND TYPES: MAN

Because of the possibility of coincidence, it is considered an inconclusive finding when the blood type of the child matches the blood type of the putative parent. Therefore, in cases of disputed parentage, blood tests can be used only to exclude the claim of maternity or paternity.

Part I. A-B-O EXCLUSION

	Parental Phenotype Combination		Blood Group of Child that Refutes

Part III. Rh-Hr EXCLUSION

This table is applicable only to matings in which at least one of the parents is Rh_o-positive. Where both parents are Rh_o-negative, all Rh_o-positive children are necessarily excluded. Boldface figures represent phenotypes of children for whom putative *maternity* is excluded; all other figures shown represent phenotypes of children for whom putative *paternity* is excluded. Code numbers and corresponding phenotypes are given in the column headings, e.g., 1 is the code number for phenotypes rh and Rh_o.

	Phenotype of Putative Mother	Phenotype of Putative Father

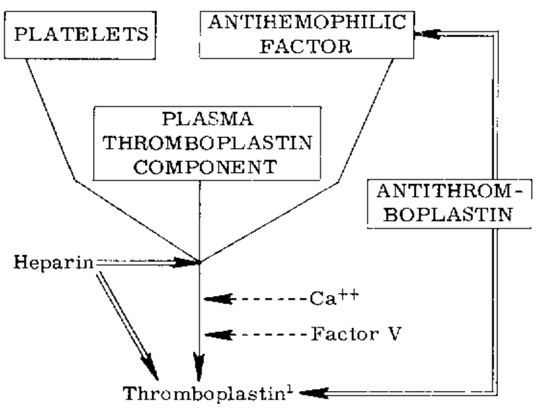
83. BLOOD COAGULATION THEORIES

Part I. ACCORDING TO F.C. MONKHOUSE AND W.W. COON (1963)

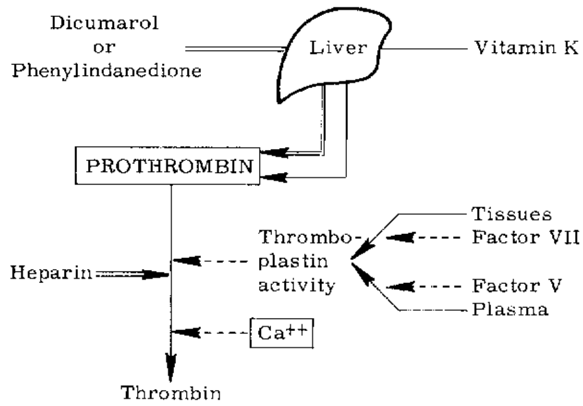
Synonymous terms for clotting factors: PLASMA THROMBOPLASTIN COMPONENT = Christmas factor, platelet cofactor-2, autoprothrombin-2; ANTIHEMOPHILIC FACTOR = antihemophilic globulin, thromboplastinogen; FACTOR V = Ac-globulin, labile factor, proaccelerin; FACTOR VII = stable factor, autoprothrombin-1, proconvertin, cothromboplastin; PLASMINOGEN = profibrinolysin; PLASMIN = fibrinolysin.

Symbols: ———► gives rise to; - - - - -► acts on; ═══► inhibits or destroys; [ ] present in blood.

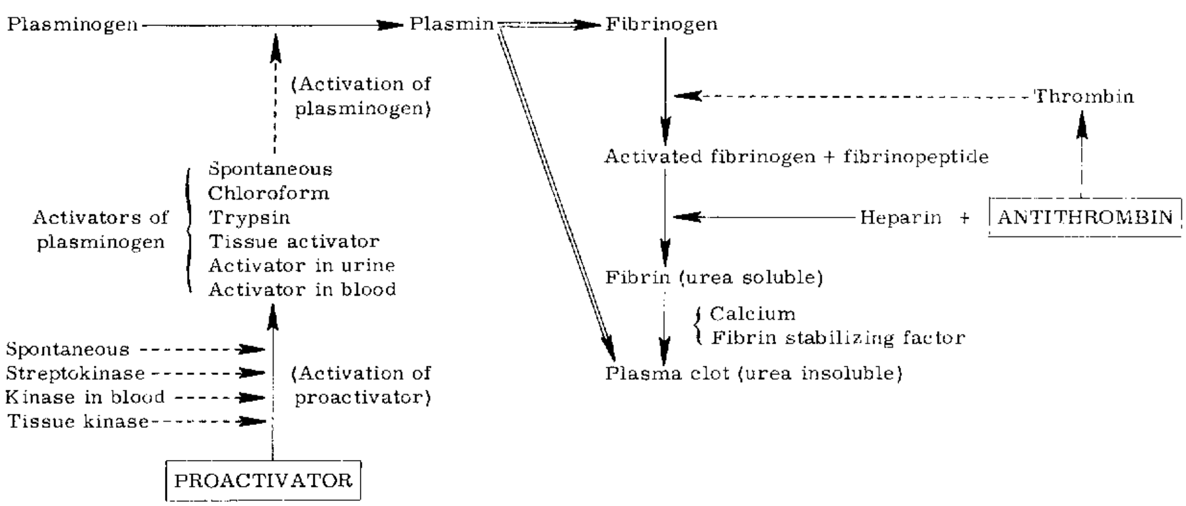
Stage I: Formation of Plasma Thromboplastin



Stage II: Formation of Thrombin



Stage III: Change of Fibrinogen to Fibrin



/1/ Other trace proteins affect the development of thromboplastin activity in plasma. Factor XII (Hageman factor) is sensitive to surface activation; its deficiency results in prolonged clotting time but no increase in bleeding time. The exact point of action of Factor X (Stuart-Prower factor) has not yet been determined.

Contributors: (a) Monkhouse, Frank C., (b) Coon, William W.

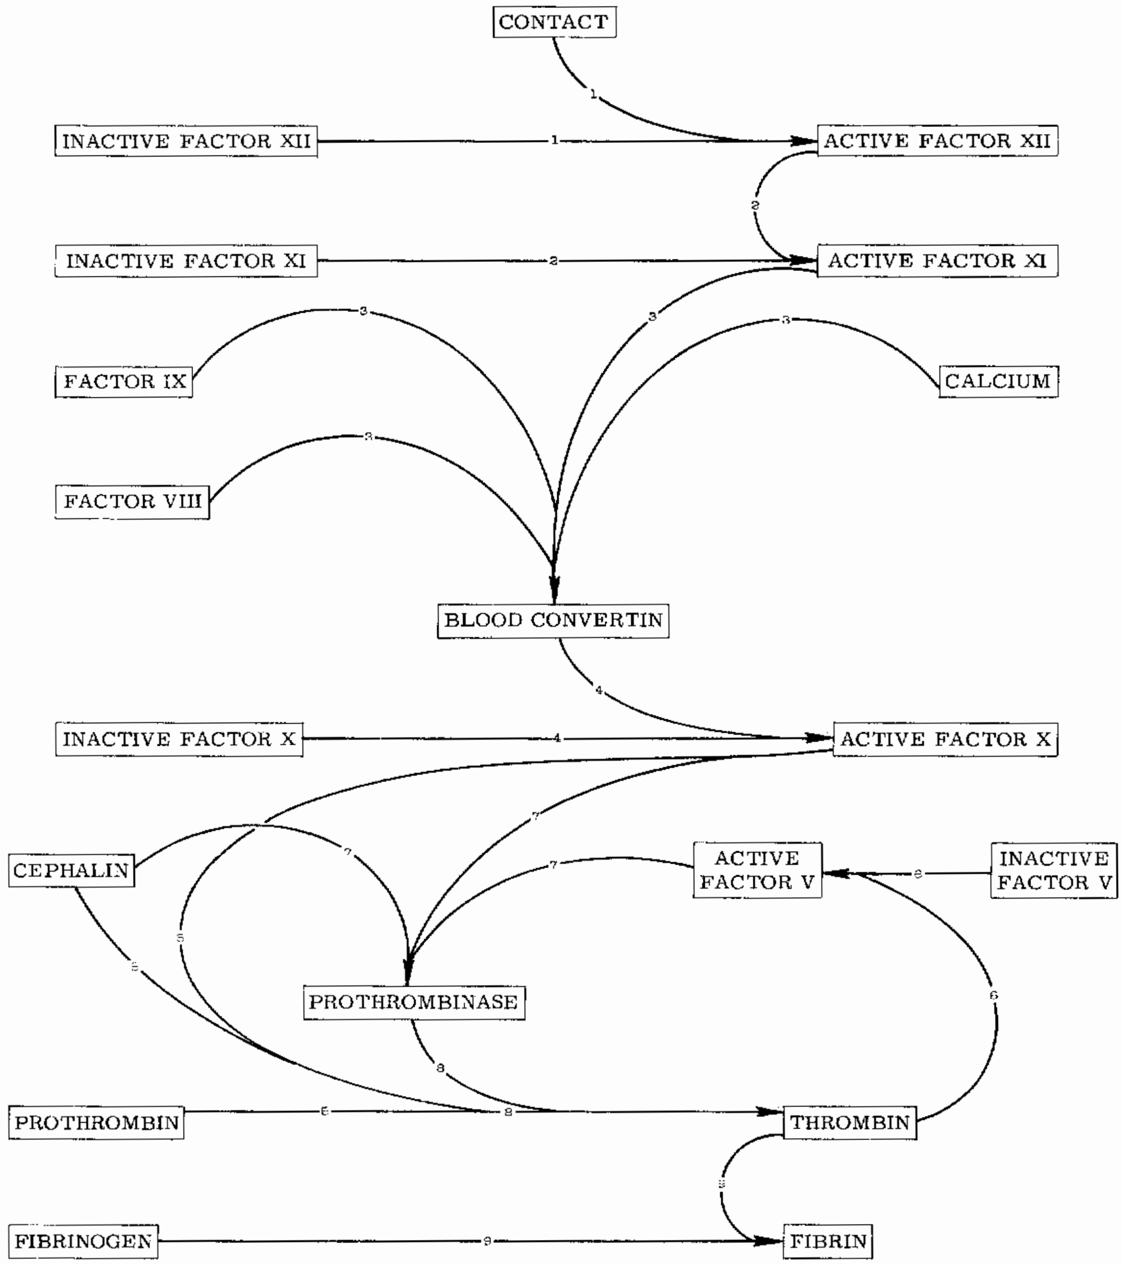
continued

83. BLOOD COAGULATION THEORIES

Part II. ACCORDING TO P. A. OWREN (1963)

System I: Intrinsic Blood Coagulation

Factor VII (proconvertin) does not take part in the intrinsic blood coagulation system.



/1/ CONTACT activates INACTIVE FACTOR XII (Hageman factor) to ACTIVE FACTOR XII. /2/ ACTIVE FACTOR XII activates INACTIVE FACTOR XI (plasma thromboplastin antecedent, PTA) to ACTIVE FACTOR XI. /3/ ACTIVE FACTOR XI, FACTOR IX (antihemophilia B factor, Christmas factor), FACTOR VIII (antihemophilia A factor, antihemophilic globulin), and CALCIUM interact to form BLOOD CONVERTIN. /4/ BLOOD CONVERTIN activates INACTIVE FACTOR X (Stuart-Prower factor) to ACTIVE FACTOR X. /5/ ACTIVE FACTOR X and CEPHALIN in the presence of calcium bring about a minimal conversion of PROTHROMBIN to THROMBIN. /6/ This initially formed THROMBIN starts the accelerator system, i.e., the conversion of INACTIVE FACTOR V (proaccelerin) to ACTIVE FACTOR V (accelerin). /7/ ACTIVE FACTOR X, ACTIVE FACTOR V, and CEPHALIN interact in the presence of calcium to form PROTHROMBINASE. /8/ PROTHROMBINASE produces rapid conversion of PROTHROMBIN to THROMBIN. /9/ THROMBIN is now formed in sufficient quantities to convert FIBRINOGEN to FIBRIN.

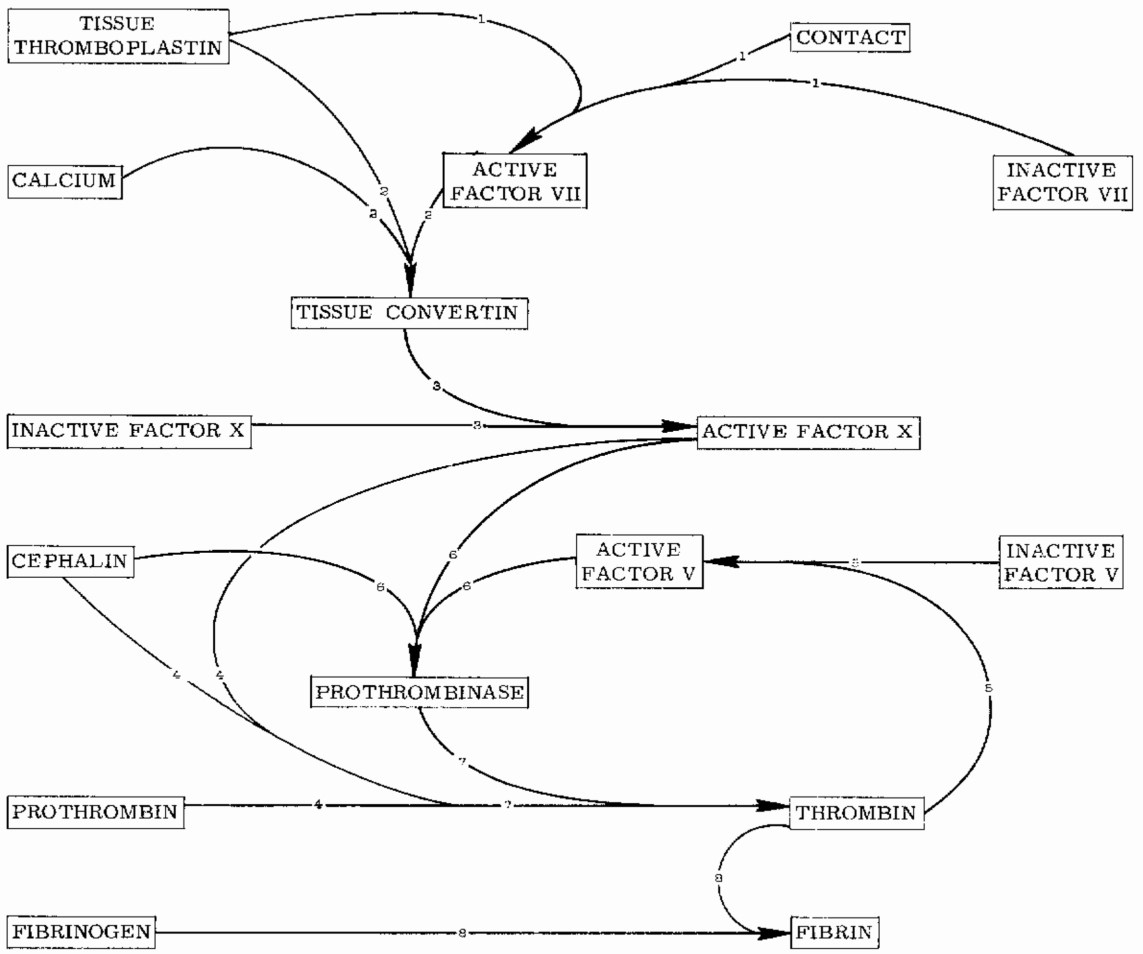
continued

83. BLOOD COAGULATION THORIES

Part II. ACCORDING TO P. A. OWREN (1963)

System II: Extrinsic (tissue-blood) Coagulation

Platelets and antihemophilic factors do not take part in the extrinsic blood coagulation system.



/1/ CONTACT (mediated through activation of factors XII and XI) and/or TISSUE THROMBOPLASTIN activates INACTIVE FACTOR VII (proconvertin) to ACTIVE FACTOR VII. /2/ TISSUE THROMBOPLASTIN (liberated by tissue injury), ACTIVE FACTOR VII, and CALCIUM interact to form TISSUE CONVERTIN. /3/ TISSUE CONVERTIN activates INACTIVE FACTOR X (Stuart-Prower factor) to ACTIVE FACTOR X. /4/ ACTIVE FACTOR X and CEPHALIN in the presence of calcium bring about a minimal conversion of PROTHROMBIN to THROMBIN. /5/ This initially formed THROMBIN starts the accelerator system, i.e., the conversion of INACTIVE FACTOR V (proaccelerin) to ACTIVE FACTOR V. /6/ ACTIVE FACTOR X, ACTIVE FACTOR V, and CEPHALIN interact in the presence of calcium to form PROTHROMBINASE. /7/ PROTHROMBINASE produces rapid conversion of PROTHROMBIN to THROMBIN. /8/ THROMBIN is now formed in sufficient quantities to convert FIBRINOGEN to FIBRIN.

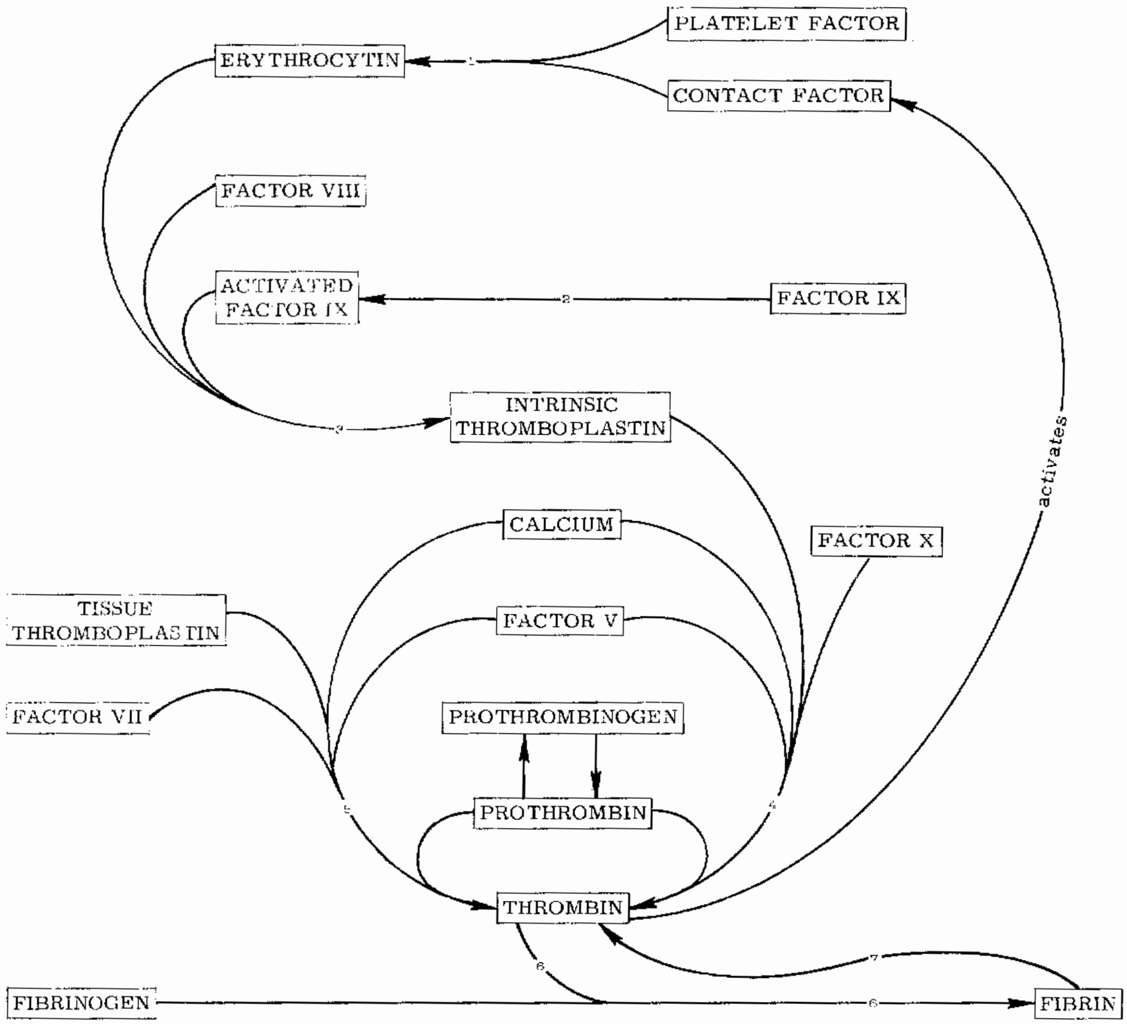
83. BLOOD COAGULATION THEORIES

Part III. ACCORDING TO A. J. QUICK (1963)



/1/ A plasma constituent, tentatively named CONTACT FACTOR, after activation by thrombin or by contact with glass, reacts with a PLATELET FACTOR to form ERYTHROCYTIN. /2/ FACTOR IX (plasma thromboplastin component) is inactive in plasma but is activated during coagulation. The activator mechanism is not known. /3/ ERYTHROCYTIN, FACTOR VIII (thromboplastinogen), and ACTIVATED FACTOR IX (activated plasma thromboplastin component) interact to form INTRINSIC THROMBOPLASTIN. /4/ INTRINSIC THROMBOPLASTIN, CALCIUM, FACTOR V (labile factor), and possibly FACTOR X (Stuart-Prower factor) interact with PROTHROMBIN to form THROMBIN. In human blood, a large fraction of prothrombin is inactive but becomes activated during coagulation in glass. /5/ When TISSUE THROMBOPLASTIN is utilized, FACTOR VII (stable factor) is required in addition to CALCIUM and FACTOR V. /6/ THROMBIN acts enzymatically on FIBRINOGEN to convert it to FIBRIN. /7/ The prompt removal of THROMBIN by adsorption on FIBRIN holds in check the autocatalytic reaction mediated through the activation of THROMBIN on the CONTACT FACTOR.

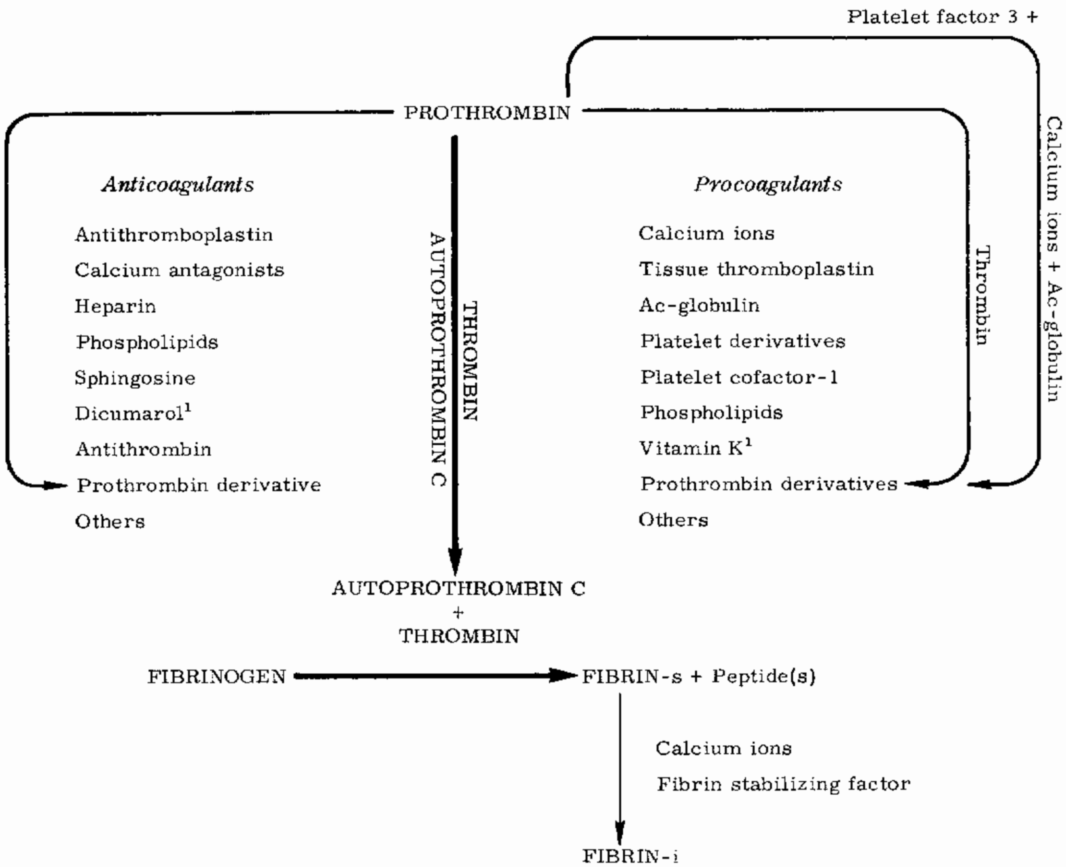
83. BLOOD COAGULATION THEORIES

Part IV. ACCORDING TO W. H. SEEGERS (1963)

Prothrombin is found in the blood and may become activated in the presence of one or more procoagulants. Since prothrombin itself contains all the necessary material for the formation of thrombin, purified prothrombin can be activated to thrombin and autoprothrombin C by placing it in 25% sodium citrate solution. Consequently the activators of prothrombin are catalysts and do not enter into stoichiometric combination with prothrombin to form thrombin. Anticoagulants inhibit the activation. Ordinarily the procoagulants and anticoagulants are present in balanced proportion. This balance is readily disturbed by the procoagulants from injured tissues. Contact with foreign surfaces also promotes prothrombin activation and platelet disintegration. With certain combinations of procoagulants, prothrombin is only partially activated, and these derivatives of prothrombin themselves accelerate the conversion of prothrombin to thrombin. Thrombin functions as activator of prothrombin, and a second enzyme from prothrombin, called autoprothrombin C, functions similarly. Prothrombin activation is primarily by autocatalysis. Thrombin also functions with accelerator systems, such as plasma Ac-globulin which becomes serum Ac-globulin, and it further supports the dissolution of platelets. Plasma antithrombin eventually destroys thrombin activity. By proteolysis, thrombin splits peptides from fibrinogen and acts as a polymerase in the polymerization of the activated fibrinogen. In the presence of calcium ions and fibrin stabilizing factor, the fibrin of a normal clot forms. Vitamin K is needed for the metabolic production of prothrombin and its derivatives, whereas dicumarol may interfere with normal prothrombin metabolism.



/1/ Related to prothrombin production.

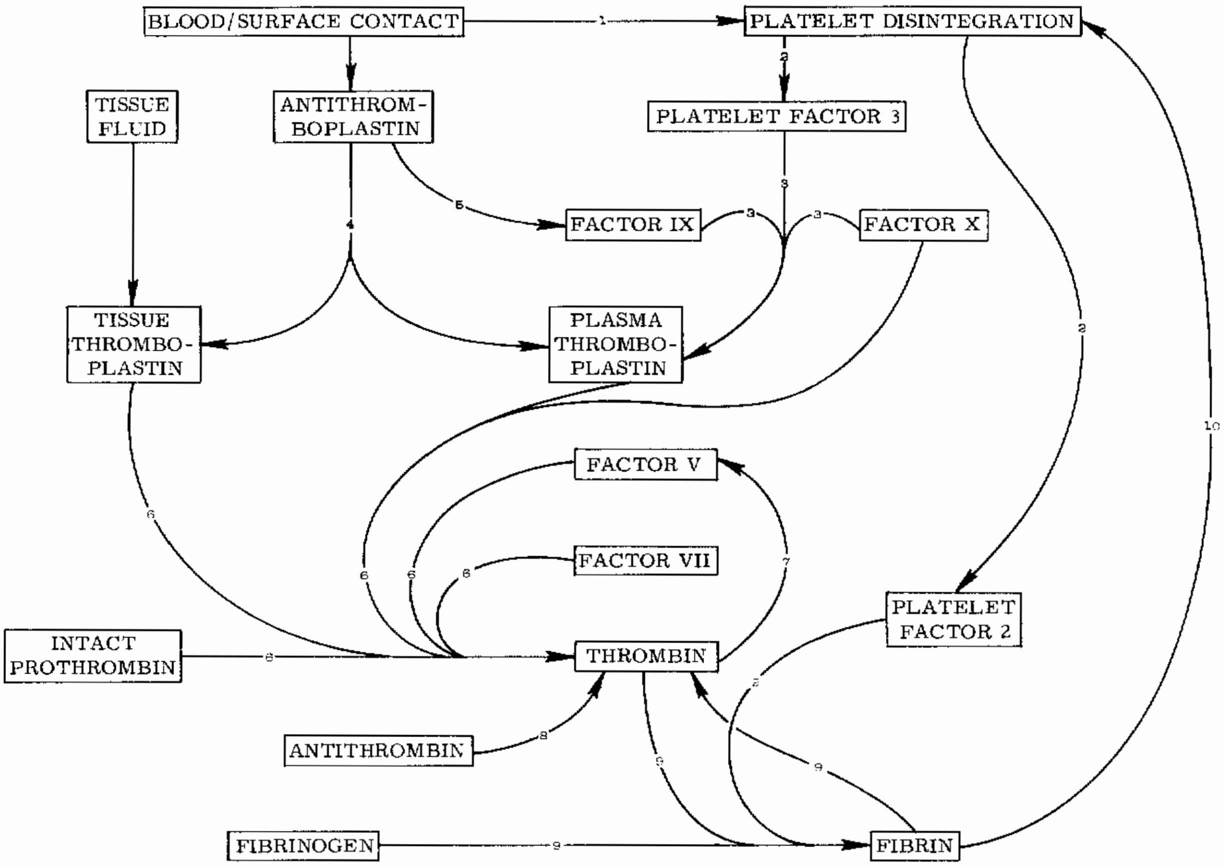
83. BLOOD COAGULATION THEORIES

Part V. ACCORDING TO L. M. TOCANTINS (1960)



/1/ CONTACT of BLOOD with certain SURFACES (damaged blood vessel endothelium, glass) initiates the first changes in the inception of clotting. Blood PLATELETS adhere to the surface and to each other, swell and DISINTEGRATE. /2/ PLATELET DISINTEGRATION releases, among other substances, PLATELET FACTOR 3 (cephalin-like factor) and PLATELET FACTOR 2 (a fibrinoplastic factor). /3/ Conjugation of PLATELET FACTOR 3 with FACTOR IX (platelet cofactor in plasma, plasma thromboplastin component) leads, with the aid of FACTOR X (Stuart-Prower factor), to formation of PLASMA THROMBOPLASTIN. /4/ Plasma ANTITHROMBOPLASTIN slows or blocks formation of THROMBOPLASTIN and, less effectively, offsets the action of formed THROMBOPLASTIN. Antihemophilic globulin is considered to represent various stages of development of plasma thromboplastin, or various degrees of conjugation of the platelet lipid and its plasma cofactor. /5/ Plasma ANTITHROMBOPLASTIN is probably a lipid in conjugation with FACTOR IX. /6/ THROMBOPLASTIN (from TISSUES, or generated in PLASMA) brings about, with the aid of FACTOR V (Ac-globulin) and FACTOR VII (convertin), a minimal amount of conversion of PROTHROMBIN to THROMBIN. /7/ This initial THROMBIN activates further transformation of PROTHROMBIN to THROMBIN, with the help of FACTOR V. /8/ Some of the THROMBIN may be inactivated by ANTITHROMBIN. /9/ The THROMBIN that escapes such inactivation acts, with the aid of PLATELET FACTOR 2, to convert FIBRINOGEN to FIBRIN. Some of the THROMBIN is removed from the plasma by adsorption on FIBRIN. /10/ Adhesion of platelets to FIBRIN probably causes further PLATELET DISINTEGRATION.

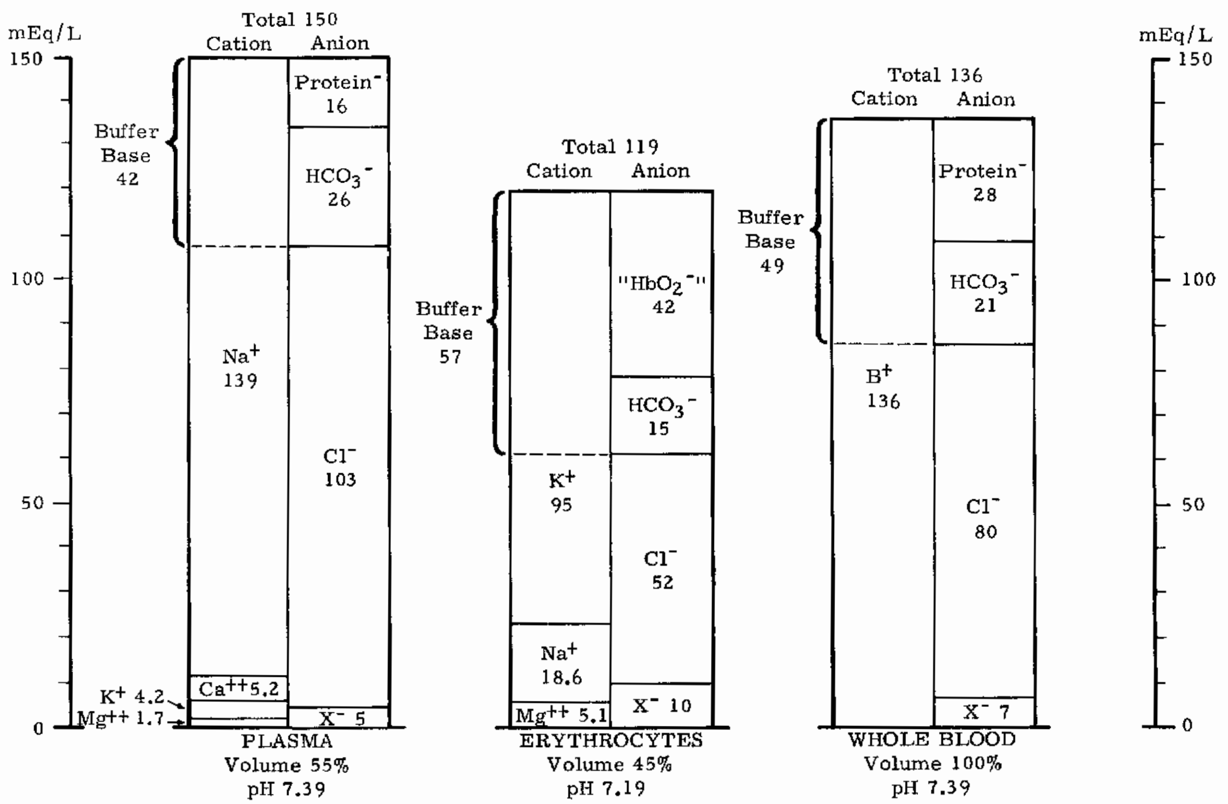
Part III. NORMAL IONIC PATTERNS, ARTERIAL BLOOD: MAN

Values are for the adult male and are based on the literature. X^- = undetermined anion residue. "HbO_2^-" includes other erythrocyte buffer anions, such as organic phosphate. B^+ = mEq total cation (Na^+, K^+, etc.) in 1 liter of blood, on the basis of a hematocrit value of 45%. Buffer base = the appropriate fraction of total cations and its equivalent of total anions (labile fraction), i.e., proteinate, bicarbonate, oxyhemoglobinate, organic phosphate, and other erythrocyte buffer anions. CO_2 partial pressure or tension for plasma, erythrocytes, or whole blood = 41 mm Hg.



Contributor: Singer, Richard B.

Part IV. CLASSIFICATION OF ACID-BASE DISTURBANCES: MAN

Ranges for acid-base variables, as reported in the literature or inferred from related observations, are for adult arterial or cutaneous blood. *See also* normal values, Part I. Limits given are approximate. Boldface type (columns B and C) indicates the best index for existence of the particular condition.

	Condition	Buffer Base[1] mEq/L	CO_2 Pressure mm Hg	Bicarbonate[2] mEq/L	pH at 37°C
	(A)	(B)	(C)	(D)	(E)
1	Normal (arterial or cutaneous blood)	46-52	35-45	24-28	7.35-7.45
2	Metabolic acidosis (acid excess or base deficit)	**Always low** 20-46	Usually low 15-35	Usually low 4-24	Usually low 6.8-7.35

/1/ Buffer base for whole blood of normal hemoglobin concentration = 15 g/100 ml. A decrease in buffer base of whole blood is almost always accompanied by a decrease in plasma or extracellular Na^+ relative to $Cl^- + X^-$, e.g., decrease in plasma Na^+, increase in plasma Cl^- or plasma X^-, or any appropriate combination. An increase in buffer base of whole blood is accompanied by an increase in Na^+ relative to $Cl^- + X^-$, e.g., increase in plasma Na^+, decrease in plasma Cl^-, or any appropriate combination. *See* normal values in diagram, Part III. /2/ Comprises about 90-98% of total carbon dioxide in plasma; average, 95%.

84. ACID-BASE BALANCE

Part IV. CLASSIFICATION OF ACID-BASE DISTURBANCES: MAN

	Condition	Buffer Base[1] mEq/L	CO_2 Pressure mm Hg	Bicarbonate[2] mEq/L	pH at 37°C
	(A)	(B)	(C)	(D)	(E)
3	Respiratory acidosis (H_2CO_3 excess)	Normal or high 46-70	**Always high** 45-100+	Usually high 28-45	Usually low 7.0-7.35
4	Metabolic alkalosis (base excess or acid deficit)	**Always high** 52-75	Normal or high 35-55	Usually high 28-50	Usually high 7.45-7.65
5	Respiratory alkalosis (H_2CO_3 deficit)	Normal or low 40-52	**Always low** 10-35	Usually low 15-24	Usually high 7.45-7.70
6	Mixed acidosis (combination of lines 2 and 3)	Always low 25-45	Always high 45-100	Variable 10-35	Always low 6.8-7.35
7	Mixed alkalosis (combination of lines 4 and 5)	Always high 52-70	Always low 15-35	Variable 20-45	Always high 7.5-7.7
8	Mixed hypercapnia (combination of lines 3 and 4)	Always high 52-75	Always high 45-100	Always high 30-50	Variable 7.3-7.6
9	Mixed hypocapnia (combination of lines 2 and 5)	Always low 20-46	Always low 10-35	Always low 4-22	Variable 7.0-7.6

/1/ Buffer base for whole blood of normal hemoglobin concentration = 15 g/100 ml. A decrease in buffer base of whole blood is almost always accompanied by a decrease in plasma or extracellular Na^+ relative to $Cl^- + X^-$, e.g., decrease in plasma Na^+, increase in plasma Cl^- or plasma X^-, or any appropriate combination. An increase in buffer base of whole blood is accompanied by an increase in Na^+ relative to $Cl^- + X^-$, e.g., increase in plasma Na^+, decrease in plasma Cl^-, or any appropriate combination. *See* normal values in diagram, Part III. /2/ Comprises about 90-98% of total carbon dioxide in plasma; average, 95%.

For additional information, consult reference 1, Part I.

Part I. VERTEBRATES

For a summary of blood methods and interpretations, consult reference 11. Subjects were normal, adult animals. Plasma and erythrocyte volumes were obtained by various dilution methods (diluent or tagging substance is given in the pertinent method column). Venous hematocrit values were obtained by centrifuging the blood sample (3,000 rpm, 30 minutes, 18 cm radius). In most instances, whole blood volume was calculated from other values in the same study; where a tagging substance is given in column H, blood volume was determined directly by dilution of the tagged erythrocytes in whole blood, on the assumption that the erythrocyte concentration in the sampled blood represented the total body erythrocyte concentration. **Method** (columns C, E, H): PV = plasma volume; EV = erythrocyte volume; VH = venous hematocrit; BV = whole blood volume. Values in parentheses are ranges, estimate "c" (cf. Introduction).

86. ERYTHROCYTE AND PLATELET VALUES

For information on additional species, consult reference 4, Part I.

Part I. ERYTHROCYTE AND HEMOGLOBIN VALUES: VERTEBRATES

Values in parentheses are ranges, estimate "c" unless otherwise indicated (cf. Introduction).

	Species (Common Name)	Erythrocyte Count million/cu mm blood	Erythrocyte Packed Volume (Hematocrit) ml/100 ml blood	Erythrocyte Volume (Mean Corpuscular) cu μ	Hemoglobin Concentration g/100 ml blood	Hemoglobin Concentration g/100 ml erythrocytes	Erythrocyte Hemoglobin Content μμg	Erythrocyte Dimensions[1] (Dry Film), μ	Reference
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)	(I)
	Mammalia								
	Homo sapiens (man)								7-9, 12-14, 17, 23
1	At birth[2]	5.7 (4.8-7.1)	56.6	106	21.5 (18.0-27.0)	38.0	38		
2	1st da	5.6 (4.7-7.0)	56.1	106	21.2 (17.7-26.5)	37.8	38		
3	1st wk	5.3 (4.5-6.4)	52.7	101	19.6 (16.2-25.5)	37.2	37		
4	2nd wk	5.1 (4.3-6.0)	49.6	96	18.0 (14.5-24.2)	36.3	35		
5	3rd wk	4.9 (4.1-6.0)	46.6	93	16.6 (13.2-23.0)	35.6	34		
6	4th wk	4.7 (3.9-5.9)	44.6	91	15.6 (12.0-21.8)	35.0	33		

/1/ Dimensions for mammals are diameters. /2/ When cord was clamped after placental separation rather than immediately after birth, erythrocyte count was 560,000/cu mm greater, and hemoglobin 2.6 g/100 ml greater, during first week of life. Erythrocyte and hemoglobin values were higher for heel blood (capillary) than for blood from superior sagittal sinus.

88. BONE MARROW DIFFERENTIAL CELL COUNTS

Part I. RIB: DOG

Values in parentheses are ranges, estimate "c" unless otherwise specified (cf. Introduction).

	Specification	Mulligan	Mulligan	Values from Rekers and Coulter	Stasney and Higgins[1]	Van Loon and Clark
	(A)	(B)	(C)	(D)	(E)	(F)
1	Number of subjects	21	35	36	35	81
2	Age of subjects	0.5-2.5 da	Adult	19-24 mo	Adult	Adult
	Cells, % of total count					
3	Proerythroblasts	1.3(0.4-3.2)[2]	0.5(0-1.4)[2]	0.3(0-1.3)[3]		0.6(0.2-2.7)[2]
	Normoblasts					
4	Early	5.8(3.0-9.5)[4]	1.5(0.4-3.8)[5]	28.2(8.0-53.9)[4]	59(40-78)	7.8(6.4-10.0)[5]
5	Intermediate	45.1(33.0-56.6)[6]	38.1(18.6-63.6)[6]			16.4(11-26)[7]
6	Late			4.6(0-11.2)[6]		17.4(9-26)[8]
7	Myeloblasts		0.6(0-1.8)	1.9(0.2-3.7)	2.4(0-5.1)[9]	0.6(0.2-1.0)
8	Promyelocytes	0.8(0-2.2)	1.5(0.2-4.6)	0.7(0-3.3)	2.8(0-5.8)	1.6(0.7-2.8)
9	Myelocytes			2.7(0-9.5)		6.0(2.7-10.0)
10	Neutrophilic	4.3(2.0-6.6)	4.7(2.2-11.2)		8.9(2.8-15.0)	
11	Eosinophilic				1.2(0-2.4)	
12	Metamyelocytes	9.7(7.2-12.0)	10.5(5.6-20.0)	5.1(0-24.4)[10]	15.3(7.2-23.0)	3.4(1.1-4.6)
13	Band cells	20.6(14.8-28.4)[11]	31.0(16.8-53.8)[11]	42.4(16.5-62.9)[11]		11.7(6.8-17.0)
	Segmented cells					
14	Neutrophilic	3.4(0.8-6.6)	3.9(0.2-8.6)	5.0(0.2-14.3)	5.1(0-12.5)	30.1(17-44)
15	Eosinophilic	2.4(0-5.2)	3.7(1.0-6.8)	4.7(0.2-19.3)	2.8(0-6.8)	2.0(0.4-3.8)
16	Basophilic			0.2(0-1.3)	0.1(0-0.3)	
17	Lymphocytes	3.3(1.6-6.0)	1.9(0-6.6)	0.7(0-8)	1.2(0.2-2.3)	0.9(0.2-2.7)
18	Monocytes					0.2(0-0.3)
19	Megakaryocytes			0.6(0-1.1)	0.1(0-0.5)	0.5(0-1.4)
20	Plasma cells			0.4(0-2.1)		
21	Reticulum cells				1.0(0-2.1)	
22	Unclassified cells	3.1(0.8-5.4)	2.1(0.8-6.1)	3.0(0-15.7)	0.2(0-0.7)[12]	
	Reference	1	2	3	4	5

/1/ Ranges are estimate "b" (cf. Introduction). /2/ Pronormoblasts. /3/ Megaloblasts /4/ Erythrocytes. /5/ Basophilic normoblasts. /6/ Normoblasts. /7/ Polychromic normoblasts. /8/ Orthochromic normoblasts. /9/ Includes leukoblasts. /10/ Juvenile cells. /11/ Stab cells. /12/ Includes heterophils.

IX. BIOLOGICAL REGULATORS AND TOXINS

89. ENZYMES

Part I. CATALYTIC ACTION

Catalytic Action (column B) and **Cofactors** (column F): ADP = adenosine diphosphate; AMP = adenosine-5'-monophosphate; ATP = adenosine triphosphate; CoA = coenzyme A; NAD^+ = nicotinamide adenine dinucleotide; $NADP^+$ = nicotinamide adenine dinucleotide phosphate. **Method** (column G): Chem = chemical; Col = colorimetric; Enzy = enzymatic; Mano = manometric; Pol = polariscopic; Phys = physical; Thun = Thunberg; Titr = titrimetric; Turb = turbidity. Figures (column G) are wavelengths used for measuring light absorption.

	Enzyme	Catalytic Action (Substrate → Product)	Conditions Suitable for Enzyme Action[1]: pH	Substrate Concentration	Temp. °C	Cofactor	Method	Occurrence
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
1	Aceto-coenzyme A-kinase	ATP + acetate + CoA → acetyl CoA + AMP + pyrophosphate	7.5	0.005 *M*	37	Mg^{++}, K^+	Chem	Yeast
2	Acetylcholine esterase	Acetylcholine → acetate + choline	7.4	3 mg/ml	37	....	Mano	Liver, pancreas, brain, blood
3	Aconitase	Citric acid → *cis*-aconitic acid[2]	7.4	0.03 *M*	25	Fe^{++}	240 mμ	Tissues, bacteria, yeasts, seeds, leaves
4	Adenase	Adenine → hypoxanthine + NH_3	8.7	....	40	....	Chem	Muscle, milk, blood
5	Adenosinetriphosphatase	ATP → ADP + PO_4	7.5	1 mg P/ml	37	Ca^{++}	Chem	Brain, muscle, venoms, potatoes
6	Alcohol dehydrogenase	Ethanol → acetaldehyde	7.8	0.03%	20	NAD^+	Mano	Liver, kidney, brain, blood, yeasts, bacteria, higher plants
7	Aldolase	Fructose-1, 6-diphosphate → triosephosphates	9	0.01 *M*	38	Co^{++}, Fe^{++}, or Zn^{++}	Chem	Muscle, *Escherichia coli*, yeasts, higher plants
8	Amino acid carboxylase	Amino acid → amines + CO_2	4-5.5	0.001 *M*	30	Pyridoxal phosphate	Mano	Liver, kidney, pancreas, bacteria, higher plants
9	D-Amino acid oxidase	D-Amino acids + O_2 → α-keto acids + H_2O_2 + NH_3	8.6	0.01 *M*	38	....	Mano	Widespread (animals); fungi
10	L-Amino acid oxidase	L-Amino acids + O_2 → α-keto acids + H_2O_2 + NH_3	8.8	0.015 *M*	38	....	Mano	Liver, kidney, venoms, fungi, bacteria
11	Aminotripeptidase	Tripeptide → dipeptide + amino acid	8.0	0.05 *M*	39	....	Titr	Mucosa, muscle
12	α-Amylase (animal)	Starch or glycogen → dextrins + maltose	7	1%	37	NaCl	Chem	Liver, saliva, urine
13	α-Amylase (plant)	Starch or glycogen → dextrins + maltose	4.5-5.5	12 mg/ml	30	....	Chem	Bacteria, yeasts, cereals
14	β-Amylase (animal, plant)	Starch → dextrins + maltose	4-5	12 mg/ml	...	....	......	Cereals, soybeans, sweet potatoes
15	Amylophosphorylase	Dextrin + glucose-1-phosphate → starch or glycogen + phosphate	6.8	0.001 *M*	30	Starch or glycogen	Chem	Widespread (animals, plants)
16	Amylosucrase	Sucrose → "glycogen" + fructose	5.6	10 mg/ml	23	....	Chem	Bacteria
17	Apyrase	ATP → AMP + 2 phosphate	6.5	....	30	Ca^{++}	Chem	Liver, muscle, yeasts, tubers

/1/ Conditions vary with the method used and with the source of the enzyme. /2/ To isocitric acid.

89. ENZYMES

Part I. CATALYTIC ACTION

	Enzyme	Catalytic Action (Substrate → Product)	Conditions Suitable for Enzyme Action[1] pH	Substrate Concentration	Temp. °C	Cofactor	Method	Occurrence
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
18	Arginase	L-Arginine → L-ornithine + urea	9.5	0.66%	38	Co^{++}, Mn^{++}	Mano	Liver, bacteria, fungi, seeds, spleen
19	Ascorbic acid oxidase	L-Ascorbic acid + O_2 → dehydroascorbate + H_2O	6.0	0.01 *N*	20	....	Mano	Widespread (plants)
20	Asparaginase	L-β-Asparagine → L-aspartic acid + NH_3	8	0.5 *M*	40	....	Chem	Liver, mucosa, bacteria, fungi, seeds
21	Aspartase	L-Aspartic acid → fumaric acid + NH_3	7-7.5	0.1 *M*	37	....	Chem	Bacteria, yeasts, leaves
22	Carbonic anhydrase	H_2CO_3 → CO_2 + H_2O	5-9	0.08 *M*	15	....	Mano	Erythrocytes, gastric mucosa
23	Carboxypeptidase	Peptide (free COOH) → amino acid + peptide	8.5	6% edestin	25	....	Titr	Pancreas (as xymogen)
24	Catalase	H_2O_2 → H_2O + O_2	6.8	0.01 *N*	0	....	Chem	Erythrocytes, liver, kidney, bacteria, higher plants
25	Chlorophyllase	Chlorophyll → chlorophyllide + phytol	5.9	1 mg/ml	25	$CaCl_2$	Chem	Bacteria, leaves, stems
26	Cholesterol esterase	Cholesterol esters → cholesterol + acids	5.3 or 7	....	...	....	......	Liver, kidney, spleen, intestinal mucosa, blood, pancreas, bacteria
27	Choline acetylase	Choline + acetyl CoA → acetylcholine	7	....	...	CoA, ATP	Chem	Brain, muscle, bacteria
28	Chymotrypsin	Proteins → polypeptides + amino acids	7.6	5% casein	38	....	Chem	Pancreas
29	Conjugase	Pteroylglutamate → pterine + glutamic acid	7-8	....	37	Ca^{++}	......	Pancreas, tissues, yeasts, tubers
30	Cytochrome-*c* oxidase	Ferro-cytochrome-*c* + O_2 → ferri-cytochrome-*c* + H_2O	7.2	0.0001 *M*	37	....	Mano	Widespread (animals, plants)
31	Cytochrome-*c* peroxidase	Ferro-cytochrome-*c* + H_2O_2 → ferri-cytochrome-*c* + H_2O	7.4	1.5×10^{-5} *M*	20	....	550 mμ	Yeasts
32	Cytochrome-*c* reductase	Ferri-cytochrome-*c* → ferro-cytochrome-*c*	7.3	2×10^{-5} *M*	25	$NADP^+$	550 mμ	Liver, yeasts
33	Deoxyribonuclease	Thymonucleic acid → nucleotides	6-7	0.5%	37	Mg^{++}, Mn^{++}	Phys	Intestinal mucosa, pancreas, seeds
34	Dextransucrase	Sucrose → dextran + fructose	5.6	10 mg/ml	23	....	Chem	Bacteria
35	Enolase	2-Phosphoglycerate → (enol) phosphopyruvate	7	0.1 mg P/ml	20	Mg^{++}, Mn^{++}, Zn^{++}	Chem	Muscle, yeasts, leaves
36	Esterase, simple	Ethyl butyrate → ethanol + butyrate	8.0	Saturated	20	....	Titr	Widespread (animals); seeds, fungi
37	Ficin	Proteins → amino acids and peptides?	5	....	35	H_2S, HCN, cysteine	......	Fig tree sap
38	Fructose-1, 6-diphosphatase	Fructose diphosphate + H_2O → fructose-6-phosphate + orthophosphate	8.8	0.02 *M*	25	Mg^{++}	340 mμ	Spinach
39	Fumarase	Fumaric acid → L(-)malic acid	6.6	0.025 *M*	40	....	Chem	Liver, muscle, bacteria, fungi, higher plants
40	β-Galactosidase (lactase)	Lactose → galactose + glucose	5.6	2.5%	38	....	Chem	Bacteria, seeds

/1/ Conditions vary with the method used and with the source of the enzyme.

	Name; Synonyms; Chemical Formula; (Systemic Name)	Properties	Sources	Assay Methods	Metabolites
	(A)	(B)	(C)	(D)	(E)
	Adenohypophysis				
2	Follicle-stimulating hormone; FSH	MW = 29,000-30,000; IEP = 5.1-5.2; stable pH 7-8, 30 min at 75°C; s. water, 50% acetone, 70% alcohol, 50% dioxane, ½-saturated $(NH_4)_2SO_4$	Adenohypophysis (especially sheep, swine); urine (castrates); serum (pregnant mare)	Follicular growth (hypophysectomized rat); ↑ wt of ovary and uterus (hypophysectomized, immature ♀ rat); ↑ uterine wt or hyperemia (immature mouse)	FSH-like protein
3	Growth hormone; GH, somatotropin	MW = 27,000[1]; IEP = 4.9[1]; $D_{20,w} = 7.15 \times 10^{-7}$; viscosity coefficient = 7.64; s. salt solution; sl. s. water; HNO_2 and acetylation destroy	Adenohypophysis (various species); plasma in children, 85-570 mg GH per ml	↑ tail length, tibial epiphyseal cartilage (hypophysectomized rat); body growth (hypophysectomized rat); inhibition of hemagglutination of erythrocytes sensitized to tannic acid and titrated with human GH; radioactivity of I^{131}-labeled GH unbound to anti-GH immune serum	Unknown; probably similar to other polypeptides
4	Luteinizing hormone; LH, interstitial-cell-stimulating hormone, ICSH	Sheep: MW = 30,000, IEP = 4.6, $S_{20,w} = 3.6 \times 10^{-13}$; swine: IEP = 7.45, $S_{20,w} = 6.8 \times 10^{-13}$; s. water, 40% alcohol, dilute salt solution	Adenohypophysis (especially sheep, swine)	Interstitial cell repair (hypophysectomized mouse, rat); regeneration of breast feathers (weaver finch); ↑ wt of ventral prostate (hypophysectomized rat); ↑ testes wt (pigeon); ↓ ascorbic acid in ovaries (rat)	
5	Lactogenic hormone; LTH, luteotropin, galactin, prolactin	MW = 24,100-26,000; IEP = 5.5-5.73; $D_{20,w} = 9 \times 10^{-7}$; viscosity coefficient = 6.65; $[\alpha]_D^{25^\circ} = -40.5^\circ$; s. acid alcohol, methyl alcohol; sl. s. water, dilute salt solution; one peptide chain	Adenohypophysis (especially cattle, sheep); urine (in small amounts)	↑ crop sac wt; crop gland proliferation (pigeon); ↑ milk secretion (rabbit)	
6	Thyrotropic hormone[3]; TSH, thyrotropin	MW = 24,100-26,000; inactivated by boiling, cysteine, ketene, trypsin, pepsin, and chymotrypsin; nondiffusible; one peptide chain	Probably adenohypophysis (basophilic cells)	Uptake of I^{131} by thyroid; ↓ thyroid iodine (chick); ↑ thyroid cell ht (chick); ↑ thyroid gland wt (guinea pig); ↑ swelling of thyroid slices	
	Neurohypophysis				
7	Oxytocin; oxytocic hormone, pitocin, postlobin-O, posterior-lobe principle	IEP = 7.7; not adsorbed on charcoal; destroyed by acid, trypsin, tyrosinase; s. water, concentrated acetic acid, methyl alcohol. Amino acid comp. (cattle, swine): Cys, Tyr, Isoleu, Glu(NH_2), Asp(NH_2), Cys, Pro, Leu, Gly (NH_2).	Neurohypophysis	Contraction, isolated uterus (guinea pig); ↑ milk ejection (rabbit); ↓ blood pressure (chicken)	

/1/ Values for man. Other values: simian, MW = 25,400, IEP = 5.5; cattle, MW = 45,000, IEP = 6.85; sheep, MW = lengthen. /3/ Evidence for two fractions--one to stimulate hypertrophy of acinar cells and colloid secretion from factor" that can be separated from TSH.

VERTEBRATES

Targets	Principal Effects	Effect of Deficiency (-) Excess (+)	Secretion Inhibited by (I) Stimulated by (S)	Reference	
(F)	(G)	(H)	(I)	(J)	
		Adenohypophysis			
Ovarian follicles; seminiferous tubules	↑ spermatogenesis and growth of seminiferous tubules, follicle development (no ova production or estrogen secretion unless LH present)	(-): obesity, atrophy or immaturity of gonads; no maturation of ova or sperm; ↓ libido and potency, hair; ↑ H_2O metabolism (+): growth of follicles (may be numerous); estrogen secretion (FSH + LH), enlargement of tubules	(I) circulating estrogens and possibly androgens (S) castration; menopause; low blood levels of estrogens or possibly androgens; hypothalamo-pituitary apparatus	3,7,21, 22,24-28,31	2
Bones, especially epiphyseal cartilage; fibroblasts, most tissues	↑ skeletal and soft-tissue growth, protein anabolism, fibroblastic activity; ↓ pancreatic insulin (↑ in rats), maintenance of muscle growth	(-): dwarfism and/or infantilism; delayed closure of epiphyses (+): gigantism and/or acromegaly; hypertrophy of viscera[2]	(I) estrogens or androgens (large doses)	3,7,21, 24-26, 28,31	3
Maturing graafian follicles and interstitial cells (ovaries); interstitial cells of Leydig (testes)	↑ follicle maturation (production but not maintenance of corpus luteum), estrogen secretion, androgen secretion from testes synergistic with FSH in stimulating estrogen and ovulation	(-): lack of ovulation and luteinization; little or no estrogen or androgen secretion; atrophy of interstitial tissue in ovary and testis (+): ovulation and luteinization of prepared follicles; hypertrophy of Leydig tissue; ↑ estrogen secretion (with FSH), androgen secretion	(I) high levels of ovarian and testicular hormones (S) intermediate levels of ovarian hormones; hypothalamo-pituitary apparatus	3,7,21, 22,24, 26-28, 31	4
Mammary glands; corpus luteum; crop sac (pigeon)	↑ milk secretion, progesterone secretion by developed corpus luteum, uterine nidation and decidua; ↑ crop gland growth and secretion (pigeon)	(-): lactation failure; deficient secretion of progesterone by corpus luteum (+): lactation initiation; maintenance of corpus luteum and progesterone secretion; release of estrogen and progesterone by luteal tissue; crop gland development (pigeon)	(I) or (S) effects of androgens, FSH, LH, and progesterone on target organs (S) by oxytocin, in turn (S) by suckling	3,7,21, 22,24, 26-28, 31	5
Glands of orbit (?); thyroid gland	↑ thyroid hormone synthesis and secretion, cell height of thyroid epithelium, thyroid size, serum protein-bound iodine; ↓ iodine and colloid content of thyroid; stimulates proliferation of connective tissue?	(-): myxedema; cretinism (some forms); ↓ basal metabolic rate (+): goiter; hyperthyroidism; exophthalmos[4]; ↑ basal metabolic rate	(I) ↑ circulating thyroxine (I) or (S) nervous system (S) ↓ circulating thyroxine	3,7,19, 21,22, 24,26, 28,31	6
		Neurohypophysis			
Uterine and other smooth muscles; mammary glands	↑ uterine muscle contraction (and other smooth muscles to a lesser degree); facilitates movement of sperm up fallopian tubes; initiates labor; may stimulate release of prolactin	(-): delayed uterine contraction (pre- or post-partum); ↓ milk flow (+): uterine contraction (especially if prepared by estrogen); ↑ milk flow	(S) suckling	3,7,22, 24,27, 28,31	7

48,000, IEP = 6.8; whale, MW = 39,900, IEP = 6.2. /2/ More characteristic of acromegaly, since long bones do not gland, and the other to accelerate uptake from blood and hormone synthesis. /4/ May be caused by "exophthalmos

	Neurohypophysis				
8	Vasopressin; vasopressor principle, postlobin-V, vasopressor-antidiuretic principle, ADH	IEP = 10.8; adsorbed on charcoal; inactivated by trypsin, not pepsin; solubility same as for oxytocin. Amino acid comp. (human): Cys, Tyr, Phe, Glu(NH_2), Asp(NH_2), Cys, Pro, Arg, Gly(NH_2).	Neurohypophysis	↑ blood pressure (dog, rat); antidiuretic activity (dog, rat, excreting 5 ml urine/min)	ADH-like material
	Pars Intermedia				
9	Melanocyte-stimulating hormones; MSH, melanotropins, intermedin, melanophore hormone, chromatophorotropic hormone	IEP = 4.1; dialyzable; moderately heat stable; destroyed by trypsin; stable acid, alkali; s. water; i. ether, acetone	Intermediate lobe (many species, including mammals); anterior lobe (birds porpoises); chemical synthesis	In vitro: Intensity of darkening of isolated section of skin at end of 60 min *(Rana pipiens)*. Changes in reflectance correlate with amount of MSH in solution.	
	α-MSH[5]	Polypeptide consisting of 13 amino acid residues; IEP = 10.5-11; same residues and sequence occur in ACTH			
	β-MSH[6]	18 amino acid residues; 6 are same in kind and sequence as in α-MSH; acidic; IEP = approx. 4.1. Some interspecies differences. Both α- and β-MSH dialyzable, moderately heat stable, destroyed by trypsin; heating 10 min at 100° with 0.1 *N* NaOH racemizes MSH, resulting in potentiation and prolongation of darkening effect, dilution of acid; s. water; i. ether, acetone.			
	Pineal Body				
10	Adrenoglomerulotropin; GTH; (1-methyl-6-methoxy-1, 2, 3, 4-tetrahydro-2-carboline ?)	s. alcohol, $CHCl_3$, hexane; lipoid; nonpolar; pale tan with Le Rosen reagent	Pineal body or adjacent tissues	Stimulation of aldosterone secretion (in pinealectomized, partially decerebrate dog)	Unknown
11	Melatonin; $C_{13}H_{16}O_2N_2$; (*N*-acetyl-5-methoxytryptamine)	MW = 222; max. absorption 2,780°; s. aqueous, organic solvents; blue color with Ehrlich reagent	Pineal body (mammals); isolated from pineals (man, cattle, monkey); smaller amounts in central and peripheral nerves; in vivo precursor is serotonin	Degree of lightening of isolated sections of skin of amphibians *(Rana pipiens)*	5-Methoxytryptamine and 5-methoxyindoleacetic acid isolated from pineal tissue; 6-hydroxymelatonin isolated from urine (man, rat)
	Thyroid				
12	Thyroglobulin	MW = 680,000; amino acid comp.: His, Lys, *p*-Aminotryp, Tryp, Tyr, Diiodotyr, Thyrox, Cys, Meth, Ala, Glyc, Leu, Val, Ser, Monoiodotyr, Iodothyrox	Thyroid gland (follicles)	Limb bud growth (amphibian larva); growth (thyroidectomized rat); ↑ basal metabolic rate (thyroid-deficient subjects); ↑ O_2 consumption; oxidation of succinate; prevention of goiter; survival in anoxia (rat)	Same as thyroxine and proteins; released from gland by proteases and hyaluronidase

/5/ Amino acid composition: Ac-Ser, Tyr, Ser, Met, Glu, His, Phe, Arg, Try, Gly, Lys, Pro, Val (NH_2). /6/ Amino Lys, Asp.

VERTEBRATES

Targets (F)	Principal Effects (G)	Effect of Deficiency (-) Excess (+) (H)	Secretion Inhibited by (I) Stimulated by (S) (I)	Reference (J)	
		Neurohypophysis			
Capillaries; arterioles; coronary vessels; kidney vascular bed and tubules; smooth muscles	↓ kidney excretion of H_2O; ↑ NaCl and urea excretion, blood pressure (constriction of capillaries); promotes renal tubular water reabsorption	(-): diabetes insipidus, diuresis; ↓ NaCl and urea excretion (+): smooth muscle contraction; ↑ H_2O retention, blood pressure	(I) ↓ plasma osmotic concentration; ↑ extracellular volume (S) ↑ plasma osmotic concentration; ↓ extracellular volume	3,7,22, 24,27, 28	8
		Pars Intermedia			
Chromatophore cells in skin of lower vertebrates (reptiles, amphibians, fishes); adipokinetic effect may involve liver	Rapidly (within a few min) expands chromatophores, causing pigment granules to disperse and color skin (either in vivo or in vitro). Not species-specific; MSH from animals expands melanocytes in human skin; increases during most of pregnancy. In anuran larvae, MSH causes expansion of chromatophores and contraction of guanophores. Also has adipokinetic effect.	(-): chromatophore contraction and guanophore expansion; complete lack causes permanent blanching of skin (+): hyperglycemia; darkening of skin; potentiated or supplemented by ACTH	(I) corticoids (?); may be a feedback mechanism (S) central nervous system; ACTH ?	3,17,18	9
		Pineal Body			
Zona glomerulosa of adrenal cortex	Stimulates secretion of aldosterone, possibly from ACTH-dependent precursors along a branch in synthetic chain	(-): ↓ aldosterone secretion, resulting in loss of Na^+ from body (+): ↑ aldosterone secretion	Unknown	3,8,9	10
Melanocytes in skin; gonads	Blanches skin of amphibians and fishes (very potent); antagonistic to MSH; ↓ ovulation, estrus (rat); ↓ pineal wt and uptake of H^3-melatonin on exposure to light (rat); ↑ estrus	(-): darkening of skin of animals with expandable melanocytes; ↑ gametogenesis, estrus, ovarian wt; precocious puberty (+): blanching of skin; delay or decrease in estrus, gametogenesis; ↓ ovarian wt; erythema or punched-out ulcer (man)	(I) light; level of circulating melatonin ? (S) dark (?); ↓ concentration of circulating melatonin	3,16,32	11
		Thyroid			
None as such	Storage form of hormone in thyroid follicles	(-): delayed maturation, epiphyseal closure, and growth; incomplete differentiation or metamorphosis; cretinism; dwarfism; goiter (usually nontoxic or hyperiodic); slows reflexes; ↓ mentality, circulation, cardiac output, respiration, internal absorption (+): acceleration of growth, metabolic rate, maturation or metamorphosis; toxic goiter; uncouples oxidation from phosphorylation; mitochondrial swelling; thyrotoxicosis	(I) antithyroid drugs (thiouracil, thiourea, thiocyanate); thyroxine; high intake of I_2 or I^-; severe stress (first 24-48 hr) (S) thyrotropic hormone; chronic stress	4,23, 28,31	12

acid composition: Asp, Glu (swine); Ser (ox); Gly, Pro, Tyr, Lys, Met, Glu, His, Phe, Arg, Try, Gly, Ser, Pro, Pro,

continued

	Name; Synonyms; Chemical Formula; (Systemic Name)	Properties	Sources	Assay Methods	Metabolites
	(A)	(B)	(C)	(D)	(E)
	Thyroid				
13	Thyroxine; "T4"; $C_{15}H_{11}O_4NI_4$; (β-[(3,5-diiodo-4-OH-phenoxy)-3,5-diiodophenyl]-alanine)	MW = 777; needles; MP = 232-233; $[\alpha]_D$ = -3.2° (NaOH); s. alkali water, alkali or acid alcohol; i. water, alcohol, volatile solvents	Thyroid gland; plasma; synthesized from *p*-methoxyphenol and 3,4,5-triiodinitrobenzene	Limb bud growth (amphibian larva); growth (thyroidectomized rat); ↑ basal metabolic rate (thyroid-deficient subjects); ↑ O_2 consumption; oxidation of succinate; prevention of goiter; survival in anoxia (rat)	Deaminated and decarboxylated to tetraiodothyroacetic acid; as glucuronides or sulfates in urine, bile, or feces; deiodinated to T_3 or T_2
14	3,5,3'-Triiodothyronine; "T3"; $C_{15}H_{12}O_4NI_3$	MW = 651; MP = 233; $[\alpha]_D^{29.5°}$ = +21.5° in 4.75% solution; s. HCl, alkaline water	Thyroid gland; plasma; deiodination of thyroxine	Methods similar to those for thyroxine; more active in most tests; same total calorigenic effect	
	Parathyroid				
15	Parathyroid hormone; parathormone, PTH	Max. MW = 8,500; 83 amino acid residues; stable dilute acid; s. water, saline, aqueous alcohol, 94% acetic acid, concentrated phenol, 50% glycerol; i. volatile organic solvents; inactivated by proteases, alkali; reversibly inactivated by mild oxidation	Parathyroids	Rate and degree of rise in serum Ca^{++} and decrease in serum phosphate (dog); Ca-mobilizing activity 2,000-3,000 USP units/mg; prevention of fall in plasma Ca in parathyroidectomized rat	
	Adrenal Cortex				
16	Aldosterone[7]; $C_{21}H_{28}O_5$; (11β 21-dihydroxy-3, 20-dioxopregn-4-en-18-al)	MW = 360; MP = 164; $[\alpha]_D$ = +160° (chloroform); s. organic solvents; sl. s. water. Urine concentration of aldosterone by double isotope derivative.	Zona glomerulosa of cortex (man, cattle, dog, frog, monkey, swine); precursors probably corticosterone, progesterone	Urinary Na/K ratio (adrenalectomized rat); muscle fatigue recovery (Everse and De Fremery test in adrenalectomized rat); muscular work performance (Ingle's test in adrenalectomized rat); deposition of liver glycogen (mouse, rat); wt maintenance (adrenalectomized dog); survival and growth (Kuizenga test in young, adrenalectomized rat); convulsion prevention (anti-insulin test in mouse); protection against cold (adrenalectomized rat); ↓ circulating eosinophils, circulating lymphocytes, thymus wt; chemical methods (formaldehydrogenic, reducing properties, reaction with phenylhydrazine)	Synthesized in vivo from corticosterone and progesterone; approx. 400 µg/da "turned over" in liver; mean 24 hr secretion (adult man) = 100 µg reduced in liver to tetrahydro derivative (inactive); mean excretion (man) = 10 µg/da, 30-40% as glucuronide, and 4-8% as free steroid; balance as other conjugates
17	Deoxycorticosterone[7]; DOC, DOCA; $C_{21}H_{30}O_3$; (Δ^4-pregnen-21-ol-3,-20-dione)	MW = 330; MP = 141-142; $[\alpha]_D$ = +178° (alcohol); s. acetone, benzene, chloroform, volatile solvents, vegetable oils; i. water	Adrenal cortex; synthesized commercially from cholesterol, diosgenin		Corticosterone; aldosterone; dehydrocorticosterone; pregnanediol; 17-ketosteroids
18	Corticosterone[8]; $C_{21}H_{30}O_3$; (11β, 21-dihydroxy-4-pregnene-3, 20-dione)	MW = 346; MP = 180-182; $[\alpha]_D$ = +262° (alcohol); s. organic solvents; sl. s. vegetable oils; v. sl. s. water	Adrenal cortex; blood; urine; synthesized in vitro from deoxycholic acid, pregnenolone, progesterone, cholesterol		Aldosterone; 11-dehydrocorticosterone; 17-ketosteroids (11-OH-androsterone and 11-keto-etio-cholane-3-[α]-ol-17-one)
19	Dehydrocorticosterone[8]; cortexone; $C_{21}H_{28}O_4$; (Δ^4-pregnen-21-ol-3,11,20-trione)	MW = 344; MP = 178-180; $[\alpha]_D$ = +258° (alcohol); s. organic solvents; i. water	Adrenal cortex; synthesized from deoxycholic acid		Similar to those of corticosterone; 11-ketopregnanediol main metabolite

/7/ Mineralocorticoid. /8/ Glucocorticoid.

VERTEBRATES

Targets	Principal Effects	Effect of Deficiency (-) Excess (+)	Secretion Inhibited by (I) Stimulated by (S)	Reference	
(F)	(G)	(H)	(I)	(J)	
		Thyroid			
All body cells; adenohypophysis	Regulation of rate of CHO, fat, protein, H_2O, mineral metabolism; stimulates growth, maturation, neuromuscular function, skin development, hematopoiesis, spermato- and oo-genesis, lactation, absorption through intestinal wall; regulation of TSH secretion; ↑ O_2 uptake of all organs and tissues	(-): delayed maturation, epiphyseal closure, and growth; incomplete differentiation or metamorphosis; cretinism; dwarfism; goiter (usually nontoxic or hyperiodic); slows reflexes; ↓ mentality, circulation, cardiac output, respiration, internal absorption (+): acceleration of growth, metabolic rate, maturation or metamorphosis; toxic goiter; uncouples oxidation from phosphorylation; mitochondrial swelling; thyrotoxicosis	(I) antithyroid drugs (thiouracil, thiourea, thiocyanate); thyroxine; high intake of I_2 or I^-; severe stress (first 24-48 hr) (S) thyrotropic hormone; chronic stress	4,7,15, 19,22-24,26-28,31, 34	13
	Same as thyroxine; more potent in goiter prevention, calorigenic activity, regulation of growth and metabolism			4,23, 27,28, 31	14
		Parathyroid			
Bones; kidneys, other soft tissues ?	↑ renal tubular absorption of Ca, distal renal tubular excretion of PO_4. Controls Ca and PO_4 level in blood via mineral exchange between blood and bones, and PO_4 excreted by kidneys.	(-): hypocalcemia; irritability of nervous system; convulsive seizures; tetany; phosphate retention (+): hypercalcemia, renal calculi; ↑ calcium and phosphate excretion, osteoclastic activity; ↓ growth	(I) high serum (Ca^{++}) (S) low serum (Ca^{++}); high serum (PO_4)	5,7,21, 22,24, 26-28	15
		Adrenal Cortex			
Distal renal tubule	Promotes renal excretion of K, and retention of Na and Cl; indirectly promotes reabsorption of H_2O in distal tubules; 25-100 times more potent than deoxycorticosterone	(-): ↓ Na^+, H_2O in blood and muscles; hemoconcentration; loss of Na through kidneys (+): reverse of above; hypertension; congestive heart failure	(I) ↓ K^+ concentration in blood, secretion of adrenoglomerulotropin; ↑ Na^+, hemodilution (S) glomerulotropin; ACTH; ↑ K^+, blood pressure in carotid arteries; ↓ Na^+, dehydration of blood	6,10 21,22, 24,27	16
Distal renal tubule	Similar to aldosterone; chiefly of historical interest; normally secreted only in trace amounts	(+): acute Na^+ retention and K^+ loss; hypertension; polyuria; ↑ plasma volume and edema	Unknown	6,7,10, 13,15, 21,22, 24,26-28	17
Muscles, liver, capillaries, kidneys, pancreas (?), integument, lymphoid organs and bone marrow, circulating blood cells	Effects of glucocorticoids are qualitatively comparable, but differ quantitatively for glycogen deposition in liver, muscle work performance, hypersensitivity reactions, thymus involution, gluconeogenesis, maintenance of renal function, K/Na ratio and H_2O balance, muscular fatigue recovery, cold protection, CHO metabolism,	(-): asthenia; hemoconcentration; skin pigmentation; ↓ wt, blood glucose, liver glycogen, stress resistance, blood pressure, secondary sex characteristics, growth in young; ↑ K/Na ratio in serum. Slowing of electrical discharges in nerves reversed by hydrocortisone. (+): reverse of above; Cushing's syndrome; hirsutism; negative	(S) ACTH (α-corticotropin)	6,7,10, 15,20-22,24, 26-28, 33	18
				6,7,10, 13,21, 22,24, 26-28, 33	19

continued

	Name; Synonyms; Chemical Formula; (Systemic Name)	Properties	Sources	Assay Methods	Metabolites
	(A)	(B)	(C)	(D)	(E)
	Adrenal Cortex				
20	Hydrocortisone[a]; 17-hydroxycorticosterone, cortisol; $C_{21}H_{30}O_5$; (Δ^4-pregnene-11β, 17α, 21-triol-3,20-dione)	MW = 362; MP = 217-220; $[\alpha]_D$ = +167° (alcohol); s. chloroform, ether, vegetable oils; sl. s. water	Adrenal cortex; synthesized from deoxycholic acid	Same as for aldosterone; Porter-Silber reaction; *m*-dinitrobenzene reaction	Tetrahydrocortisol; cortisone
21	Cortisone[a]; 17-OH-11-dehydrocorticosterone; $C_{21}H_{28}O_5$; (Δ^4-pregnene-17α, 21-diol-3, 11, 20-trione)	MW = 360; MP = 220-224; $[\alpha]_D$ = +209° (alcohol); s. acetone, chloroform, benzene, ether, vegetable oils; sl. s. water	Adrenal cortex; placenta; synthesized in vitro from squalene, cholesterol, pregnenolone, progesterone	Same as for aldosterone; Porter-Silber reaction	Tetrahydrocortisone; β-cortolone
22	Fluorocortisone; $C_{21}H_{29}O_5F$; (9α-fluoro-17β-[1-keto-2-hydroxyethyl]-Δ^4-androstene-3,-11-dione-17α-ol)	MW = 380; MP = 233-234 (acetate); $[\alpha]_D^{23°}$ = +123° (acetate)	Synthetic	Same as for aldosterone	
	Adrenal Medulla				
23	Epinephrine; adrenaline, suprarenine, adrenine	MW = 183; MP (L) = 207-211; $[\alpha]_D$ = -50° to -53.5°; s. alkali, acid; sl. s. water; v. sl. s. alcohol; i. ether, chloroform	Adrenal medulla; synthesized (commercially) from catechol, (in vivo) tyrosine; methylation of norepinephrine	Isolated heart stimulation (frog); uterus relaxation (cat); pupil dilation (cat); ↓ peristalsis (rabbit); ↑ blood pressure (cat)	Catechol derivatives; 50% to metanephrine (5-methoxyepinephrine), 30% to 3-methoxy-4-hydroxymandelic acid (VMA) in urine
24	Norepinephrine; arterenol, noradrenaline	MW = 169; MP (L-bitartrate) = 163-164, (L-HCl) = 146-147; solubility same as for epinephrine	Adrenal medulla; various nerves, especially splenic; spleen; heart; blood vessels	Same as for epinephrine in all tests except pressor and contraction of gravid uterus	Methylated to epinephrine by adrenals in presence of ATP; conjugated normetanephrine and VMA in urine
	Ovaries				
25	Equilenin; $C_{18}H_{18}O_2$; ($\Delta^{1,3,5:10,6,8}$-estrapentaen-3-ol-17-one)	MW = 266; MP = 258-259; $[\alpha]_D$ = +89° (dioxane); s. volatile solvents; sl. s. alcohol, vegetable oils; i. water	Synthesized; 4 stereoisomers; natural estrogen from urine (pregnant mare)	Phenolsulfonic acid (Kober); $ZnCl_2$/benzoyl Cl, sulfanilic acid/$NaNO_2$ (Pincus); spectrophotometric; estrus changes in vagina (immature mouse, rat) (Allen-Doisy)	One inactive stereoisomer is produced by catalytic dehydrogenation of estrone
26	Equilin; $C_{18}H_{20}O_2$; ($\Delta^{1,3,5:10,7}$-estratetraen-3-ol-17-one)	MW = 268; MP = 238-240; $[\alpha]_D$ = +308° (dioxane); s. volatile solvents; sl. s. vegetable oils; i. water	Urine (pregnant mare)		Easily dehydrogenated to equilenin
27	Estradiol-17β; dihydrotheelin, dihydrofolliculin, dihydroestrone, di-OH-estrin; $C_{18}H_{24}O_2$; (3,-17β-di-OH-1,3,-5:10 estratriene)	MW = 272; MP = 178; $[\alpha]_D$ = +82° (dioxane); s. alkali, volatile solvents; sl. s. vegetable oils; i. water	Urine (pregnant woman, mare, rabbit); ovary (swine); testes (stallion); human placenta; synthesized from cholesterol. Estradiol-17α from urine (pregnant cattle, goat)	*See* equilenin. Estimation of dehydrogenases in placenta.	Estradiol-17α converted to estrone, but not estradiol-17β, in calves

/a/ Glucocorticoid.

Targets	Principal Effects	Effect of Deficiency (-) Excess (+)	Secretion Inhibited by (I) Stimulated by (S)	Reference	
(F)	(G)	(H)	(I)	(J)	
		Adrenal Cortex			
Chiefly muscle, liver, connective tissue; also capillaries, kidneys, pancreas (?), integument, lymphoid organs and bone marrow, circulating blood cells	collagen maintenance, normal capillary permeability, protection against stress and shock. Corticosterone is of minor importance, but has weak antianabolic and catabolic effects. Hydrocortisone and cortisone principal glucocorticoids (man); stimulate gluconeogenesis and redistribution of fat; lymphocytopenia. (*See* preceding page)	N balance; hyperglycemia; osteoporosis; obesity; muscle wasting; diabetes; alkalosis; inhibition of inflammatory responses and wound healing; diuresis; supression of antibody formation; hyperglycemia (hydrocortisone); ↑ gastric acidity (hydrocortisone) (*See* preceding page)	(S) ACTH (α-corticotropin)	1,6,7, 10,13, 21,22, 24,26-28,33	20
				1,6,7, 10,13, 21,22, 24,26-28,33	21
Joints affected with rheumatoid arthritis				2,11, 12,29	22
		Adrenal Medulla			
Sympathetic nervous system; heart muscle; smooth and skeletal muscle; liver phosphorylase; adenohypophysis; lipase	Relaxation of nongravid uterus, peripheral arterioles, bronchial muscles; ↑ contraction of heart muscle (↑ output and rate), gravid uterus, iris muscle (radial), capillaries; ↑ spleen size, glucogenolysis, blood coagulation, ACTH secretion, salivary and sweat gland secretions; ↓ peristalsis; moderate lipolysis. Epinephrine: slight pressor effect; moderately increased cardiac output; great excitation of central nervous system; eosinopenia; hyperglycemia; greatly ↑ basal metabolic rate. Norepinephrine: great pressor effect; slight or no ↑ cardiac output; no excitation of central nervous system; slight eosinopenia and hyperglycemia; moderately ↑ basal metabolic rate.	(-): no clinical syndrome (+): over-secretion rare; may cause paroxistic hypertension and, in some instances, sustained hypertension. Norepinephrine: pheochromocytoma.	(S) sympathetic nervous system, via splanchnic nerve; stress	6,7,15, 20,22, 24,26-28,30	23
Similar to epinephrine but causes arteriolar constriction; tends to decrease cardiac output; pressor effect is not reversed by ergotoxine				6,7,22, 24,27	24
		Ovaries			
All female sex organs; mammary glands; mucous membranes; adenohypophysis	Estrogenic. Endometrial proliferation; development and maintenance of vaginal mucosa, cornification of superficial layer; antagonizes androgen effects; ↑ mammary gland duct development, uterine motility, growth of axillary and pubic hair (♀, human), growth of down (♀, bird), growth of all female secondary sex organs. β-Estradiol stimulates *trans*dehydrogenases in human placenta, slows growth of skeleton, promotes closure of epiphysis; moderately stimulates protein anabolism and calcification of bones.	Unknown		3,10, 15,21, 24,26, 27	25
		Unknown		3,15, 21,24, 26,27	26
All female sex organs; mammary glands; mucous membranes; adenohypophysis; osteoblasts		(-): immaturity or atrophy of accessory sex organs; lack of secondary sex characteristics and female behavior patterns; ↓ mammary gland development; delayed epiphyseal closure; long bones continue to grow; osteoporosis (+): precocious maturity; hypertrophy of accessory sex organs and mammary glands; estrus changes; cystic	(I) high blood levels of estrogens ? (S) LH, combined FSH and LH	3,7,10, 15,21, 22,24, 26-28, 31,33	27

continued

	Name; Synonyms; Chemical Formula; (Systemic Name) (A)	Properties (B)	Sources (C)	Assay Methods (D)	Metabolites (E)
	Ovaries				
28	Estriol; theelol, tri-OH-estrin; $C_{18}H_{24}O_3$; ($\Delta^{1,3,5:10}$-estratriene-3, 16α, 17β-triol)	MW = 288; MP = 282; $[\alpha]_D$ = +53 to +63° (dioxane); s. volatile solvents, alkali; sl. s. vegetable oils; i. water	Urine (pregnant woman); human placenta; synthesized from estrone, β-estradiol	*See* equilenin	β-Estradiol; 4-pregnene-20β-ol-3-one ⇅ estrone; 4-pregnene-20α-ol-3-one ⇅ α-estradiol ↓ estriol (principal metabolite in urine; excreted as water-soluble inactive glucuronide)
29	Estrone; theelin, folliculin, keto-OH-estrin; $C_{18}H_{24}O_2$; ($\Delta^{1,3,5:10}$-estratrien-3-ol-17-one)	MW = 270; MP = 255; $[\alpha]_D$ = +170° (dioxane); s. volatile solvents, alkali; v. sl. s. water; sl. s. vegetable oils	Adrenal cortex; urine (man, bull, steer); synthesized from cholesterol, diosgenin	*See* equilenin	
30	Progesterone; progestin, luteosterone; $C_{21}H_{30}O_2$; (Δ^4-pregnene-3,-20-dione)	MW = 314; MP (α) = 128, (β) = 121; $[\alpha]_D$ = +172 to +182° (dioxane); s. volatile solvents; sl. s. vegetable oils; i. water	Corpus luteum; placenta; adrenal cortex; synthesized from cholesterol or stigmasterol	*See* equilenin	Pregnanediol; 17α-hydroxyprogesterone
31	Relaxin; releasin	Polypeptide; IEP = 5.5; s. water and 95% alcohol	Serum (pregnant woman, cat, dog, mare, rabbit, sow); placenta; corpus luteum; ovaries; endometrium	Degree of relaxation of pelvic ligaments (guinea pig)	Unknown
	Placenta[9]				
32	Chorionic gonadotropin; HCG, prolan	MW = 30,000; IEP = 2.95; $[\alpha]_D^{20°}$ = -68°; s. water, 50% acetone, 60% alcohol; 12,000 I.U./mg	Placenta, blood, urine (pregnant female); peak in 60-75 days after first day of last menses	Corpus luteum formation (mouse); ovarian wt (rat); ovulation (rabbit); ovarian cell repair (immature, hypophysectomized rat)	Human chorionic gonadotropin excretion; basis of Aschheim-Zondek pregnancy test
	Testes				
33	Testosterone; $C_{19}H_{28}O_2$; (Δ^4-androsten-17β-ol-3-one)	MW = 288; MP = 155-156; $[\alpha]_D$ = +109° (alcohol); absorption maximum = 238 mμ; s. alcohol, ether, volatile solvents; sl. s. vegetable oils; i. water	Testes (man, bear, bull, rat, stallion); synthesized from cholesterol, acetate, and dehydroandrosterone	Alkali *m*-dinitrobenzene; $SbCl_3$-acetic anhydride (colorimetric); chromatography; comb growth (capon); blackening of bill (sparrow); ↑ wt of seminal vesicle, prostate (castrated rat). Testosterone: Girard's reagent T, followed by polarography.	Androsterone; etiocholanolone; epiandrosterone; estradiol; estrone (urine)
34	Dehydroepiandrosterone; dehydroisoandrosterone; $C_{19}H_{28}O_2$; (Δ^5-androsten-3β-ol-17-one)	MW = 288; MP (leaflets) = 152-153; $[\alpha]_D$ = +10.9° (alcohol); s. alcohol, ether, benzene; precipitated by digitonin; i. water	Urine (man, bull, pregnant cow); testes (bull); synthesized from cholesterol		May be intermediate in synthesis of androgens from acetate or pregnenalone; metabolized to androstenedione
35	Androsterone; $C_{19}H_{30}O_2$; (androstan-3-[α]-ol-17-one)	MW = 290; MP = 185.5; $[\alpha]_D$ = +87.8° (dioxane); s. volatile solvents; sl. s. vegetable oils; not precipitated by digitonin; i. water	Urine (man, bull, pregnant cow); synthesized from cholesterol or sitosterol		Dehydroepiandrosterone, Δ^4-androstene-3, 17-dione, 17-hydroxyprogesterone. Found only in urine (probably a metabolite of testosterone).

/9/ Placenta also produces estrogens and progesterone.

VERTEBRATES

Targets	Principal Effects	Effect of Deficiency (-) Excess (+)	Secretion Inhibited by (I) Stimulated by (S)	Reference	
(F)	(G)	(H)	(I)	(J)	
		Ovaries			
All female sex organs; mammary glands; mucous membranes; adenohypophysis; osteoblasts	*See* entry 25	hyperplasia of endometrium; blocking of ovulation; skeletal growth deceleration (premature closing of epiphyses); excessive calcification of tissues, if parathyroids are normal (*See* preceding page)	(I) high blood levels of estrogens ? (S) LH, combined FSH and LH	3,7,10, 15,21, 22,24, 26-28, 31,33	28
				3,7,10, 15,21, 22,24, 26-28, 31,33	29
Endometrium of uterus; mammary gland lobules and alveoli; kidney tubules; adenohypophysis	Luteinizing. Preparation of endometrium for implantation of zygote; ↓ uterine contractions; ↑ mammary gland development, metabolism and excretion of estrogens; stimulation of protein catabolism and galactose oxidation	(-): lack of normal cyclic changes and of endometrial development for implantation and gestation (+): pregestational changes; pregnancy prolongation; inhibition of uterine growth, especially of endometrium; ↑ Na and K excretion, catabolism	(S) LTH	3,7,10, 15,21, 22,24, 26-28, 31,33, 34	30
Pubic ligaments	Relaxation of pubic ligament by replacing bone with connective tissue; synergistically with other hormones promotes mammary development and softening of cervix	Not definitely known	(S) estrogens ?	3,7,22, 24,31, 33	31
		Placenta[9]			
Ovaries, especially corpus luteum	Corpus luteum maintenance in pregnancy; in nonpregnant women, stimulates ovulation. Human chorionic gonadotropin → luteinizing corpus luteum; pregnant mare serum → luteinization, follicle development.	(-): abortion (+): toxemias of pregnancy ?	(I) sex steroids	7,20, 22,26-28,31	32
		Testes			
All male sex organs; adenohypophysis; muscle; hair follicles; epiphyses of long bones; vocal cords	Androgenic. ↑ development of male secondary sex organs and sex characteristics, libido, folliculoid and luteoid activity (immature female), basal metabolic rate and protein anabolism; positive balances of N, Ca, K, P; ↓ creatinuria and amino acid catabolism.	(-): immaturity or atrophy of accessory sex organs; lack of secondary sex characteristics and male behavior patterns; poor muscle development and function; delayed closure of epiphyses; ↓ excretion of 17-ketosteroids in urine (+): precocious sex development; hypertrophy of accessory sex organs; ↑ skeletal growth until closure of epiphyses, muscle mass, hirsutism, excretion of 17-ketosteroids in urine; ↓ scalp hair ?	(I) androgens (S) FSH + ICSH	3,10, 15,21, 22,24, 26-28, 31,33	33
				3,10, 15,21, 22,24, 26,27, 31,33	34
				3,7,10, 15,21, 22,24, 26-28, 31,33	35

continued

	Name; Synonyms; Chemical Formula; (Systemic Name)	Properties	Sources	Assay Methods	Metabolites
	(A)	(B)	(C)	(D)	(E)
			Pancreas		
36	Insulin protein (polypeptide)[10]	MW = 36,000; monomer composed of two polypeptide chains; destroyed by oxidizing or reducing agents. MP = 223; IEP = 5.3; s. water, alcohol; precipitated by protein precipitants; stable acid; destroyed by alkali.	β-cells of islets of Langerhans (various species)	Convulsions (mouse); hypoglycemia (starved rabbit); glucose uptake by diaphragm (rat, mouse); metabolism of glucose-1-C^{14} by fat pad (rat); rate of displacement of beef insulin-I^{131} by human insulin (immunized guinea pig); ↓ blood glucose (adrenodemedullated, hypophysectomized, diabetic rat)	
37	Glucagon (polypeptide)[10]	MW = 3,485; 29 amino acid residues; two polypeptide chains of different lengths; IEP = 7.5-8.5; s. dilute alkali and acid; i. water; stable alkali	α-cells of islets of Langerhans	Rise of blood glucose level at intervals of 20, 30, 45, 60, 90, and 120 min after intravenous injection; rate of glycogenolysis in liver	Not known
			Gastrointestinal Tract		
38	Cholecystokinin; CCK	MW = 5,000-10,000 (?); IEP = 5.0-5.5; dialyzable; s. water	Upper intestinal mucosa	Contraction of gallbladder (dog)	Metabolized as protein ?
39	Enterocrinin	s. acid, water, alcohol; i. ether, acetone; salted out by NaCl	Intestinal mucosa (man, cat, cow, dog, hog)	↑ flow of intestinal juice in jejunum (dog)	Metabolized as protein ?
40	Enterogastrone	s. water; i. organic solvents; dialyzable; destroyed by pepsin	Duodenal mucosa	↓ stimulating effect of exogenous histamine on HCl secretion	Urogastrone ?
41	Gastrin	IEP = 8; heat stable; destroyed by ultraviolet, alkali, pepsin; dialyzable	Gastric mucosa, especially pylorus	No standard assay method	Unknown
42	Pancreozymin	Salted out by NaCl; s. absolute alcohol, water	Upper intestinal mucosa	Increase in enzymes in pancreatic juice	Unknown
43	Secretin	MP = 234; salted out by NaCl, CCl_3COOH; s. dilute acidic water	Upper intestinal mucosa	Volume of pancreatic juice (dog)	Unknown
44	Urogastrone	Same as for enterogastrone	Urine	Same as for enterogastrone	Unknown
			Nervous System		
45	Acetylcholine; ACh	MW = 163; MP (Br) = 143; quaternary salt unstable; s. water, alcohol, ether, oils; i. ether; salts v. s. water	Ganglia of parasympathetic nervous system; brain; synthesized commercially	None	

/10/ Data are for cattle.

Targets	Principal Effects	Effect of Deficiency (-) Excess (+)	Secretion Inhibited by (I) Stimulated by (S)	Reference	
(F)	(G)	(H)	(I)	(J)	
		Pancreas			
All tissues involved in carbohydrate metabolism; hexokinases in mitochondria	Regulates CHO and fatty acid metabolism; stimulates hexokinases, phosphorylases; promotes uptake of glucose by cells; oxidation of CHO; stimulates lipogenesis, transport and oxidation of lipids; stimulates amino acid transport into cells and protein synthesis; stimulates synthesis of mucopolysaccharides. ↓ gluconeogenesis, ketogenesis.	(-): diabetes mellitus (hyperglycemia, glycosuria, ketonuria; ↓ wt and blood volume, negative nitrogen balance); delayed wound healing; gangrene; dwarfism; ↓ response to growth hormone; ↓ HPO_4 uptake by cells; ↓ ATP; ↓ glycogenesis, lipogenesis, proteogenesis (+): hyperinsulinism (hypoglycemia, convulsions, nausea, muscular weakness, anxiety, confusion); ↑ food intake, fat and protein deposition	(I) low blood glucose; antagonized by growth hormone, glucosteroids (corticoids), epinephrine, thyroxine, glucagon (S) vagus stimulation; ↑ blood glucose; ↑ growth hormone; ↑ ACTH, thyroxine, estrogens	7,15, 21,22, 24,26, 28	36
Similar to insulin	Antagonistic to insulin; raises blood glucose; promotes glycogenesis in liver but not muscle; inhibits synthesis of fatty acids from precursors; ↑ O_2 consumption by tissues, excretion of ions by kidney	(-): low blood glucose (+): high blood glucose; opposes action of insulin	(I) high blood glucose ? (S) low blood glucose ?	27,28, 30,31	37
		Gastrointestinal Tract			
Gallbladder	↑ contraction and emptying of gallbladder	?	(S) fat, protein, acid in duodenum	14,21, 28	38
Secretory cells of ileum, jejunum	↑ secretion of succus entericus, volume rate and enzyme concentration	?	(S) food in intestine	14,21	39
Stomach	↓ motor activity and acid secretion of stomach	?	(S) sugar, fat in intestine	14,21, 28	40
Parietal (HCl-producing) cells, stomach	↑ HCl secretion (but not pepsin) by gastric mucosa	?	(S) mechanical distention; protein degradation products	14,21, 28	41
Enzyme-secreting cells of pancreas	↑ enzyme secretion by pancreas (no effect on volume rate)	?	(S) peptones, amino acids, soaps, fats in duodenum	14,21	42
Pancreas (acinar or exocrine), liver	↑ volume rate of pancreatic enzymes (no effect on concentration), bile secretion	(-): hyposecretion of pancreatic enzymes and bile (+): excess doubtful	(S) HCl, protein degradation products, digested fat or bile in small intestine	14,21, 28	43
Gastric mucosa and muscularis	↓ HCl secretion, stomach muscle contractions	?		14,21, 28	44
		Nervous System			
Muscles, especially involuntary (ACh released at neuromuscular junctions, synapses)	Conduction of electrical impulses along nerve fibers; arteriolar dilation; effects (cholinergic) generally opposite to those of epinephrine; ↓ heart rate	?		15,22, 24,27, 28,30	45

91. ENDOCRINE ORGANS AND HORMONES: INVERTEBRATES

	Phylum and Class	Possible Endocrine Organs or Areas[1]	Possible Endocrine Factors [Chemistry]	Effects
	(A)	(B)	(C)	(D)
1	Chordata[2]	Some neurosecretion in brain		
2		Endostyle	Minimal thyroxinogenesis	?
3	Echinodermata	Some neurosecretion in circum-oral nerve-ring and radial nerves	[Polypeptide?]	Stimulation of spawning
4				Water balance
	Arthropoda			
5	Arachnida	Brain-and-neurohemal-organ neurosecretory system		
6	Crustacea	X-organ-and-sinus-gland neurosecretory system (in eyestalk)	Somatic chromatophorotropins [Protein-polypeptide?]: A substance (=PLH of F. Brown); UDH (*Uca*-darkening hormone)	Somatic pigmentation: Concentration of red pigments; Dispersion of melanins
7			Retinal chromatophorotropin(s)	Retinal pigment movements in light and dark adaptation
8			Molt-influencing hormones (MIH and MAH)	Probable inhibition or acceleration of Y-organ secretion
9			Gonad-inhibiting hormones (in all ♀ crustaceans and ♂ crabs)	
10			Metabolic factors?	O_2 consumption, Ca^{++} metabolism, water metabolism (probably related to molting); blood sugar regulation (diabetogenic)

/1/ Neurosecretion, as used in this column, refers to the presence of special secretory-appearing neurons, regardless of evidence for actual neurohormone production. /2/ Cephalochordata and Urochordata only.

91. ENDOCRINE ORGANS AND HORMONES: INVERTEBRATES

	Phylum and Class	Possible Endocrine Organs or Areas[1]	Possible Endocrine Factors [Chemistry]	Effects
	(A)	(B)	(C)	(D)
	Arthropoda			
11	Crustacea	Brain(?)-and-postcommissure-organ neurosecretory system	Somatic chromatophorotropins [Protein-polypeptide?]:	Somatic pigmentation:
			A substance	Concentration of red pigments
			A' substance	Concentration of white and some red and black pigments
			B substance (=CDH of F. Brown)	Dispersion of red pigments
12		Thoracic-ganglion-and-pericardial-organ neurosecretory system	[5-Hydroxytryptamine?; 5,6-dihydroxytryptamine?; polypeptide?]	Frequency and amplitude of heart beat
13		Thoracic-ganglion-and-anterior-ramifications neurosecretory system		Rate of gas transport?
14		Neurosecretion in brain and ventral ganglia unrelated to known neurohemal areas		
15		Y-organ	Molting hormone (insect ecdyson?)	Rate of molting in adult; under control of sinus gland MIH and MAH
16		Androgenic gland	Androgenic hormone	Male gonad, gonoduct, and secondary sex character development. Under control of sinus gland testis-inhibitory factor in crabs?
17		Ovary?		Female secondary sex characters
18	Insecta	Brain-and-corpus-cardiacum neurosecretory system	"Brain hormone" = ecdysiotropin [Protein? or steroid related to cholesterol?]	Stimulates secretion by ecdysial (molting) gland
19		Tritocerebral neurosecretion	Chromatophorotropin in phasmids and *Corethra* larva	
20		Neurosecretion in subesophageal ganglion		Activity regulation in cockroaches; release of chromatophorotropin in phasmids; egg diapause in *Bombyx*
21		Neurosecretion in ventral ganglia		
22		Corpus cardiacum (intrinsic function)	Myotropic factors	Motility of oviduct, gut, Malpighian tubules
23			Cardioaccelerator factor (produced by pericardial cells under corpus cardiacum stimulation?) [Orthodiphenol?]	Heart beat
24			Diabetogenic factor	Blood sugar regulation
25				Depression of spontaneous activity in nerve cords
26		Corpus allatum	Neotenin = "juvenile" hormone [Fat-soluble; related to farnesol ($C_{15}H_{25}OH$)?]	Larval and nymphal development; gonadotropic in some ♀ insects (not Lepidoptera or phasmids)
27		Corpora cardiaca and allata	Metabolic factors?	Water metabolism?
28		Ecdysial (molting) gland: ventral, prothoracic, thoracic, peritracheal, etc.	Ecdyson = growth and differentiation (GD) hormone = molting hormone [$C_{27}H_{44}O_6$ (polyhydroxysteroid)]	Larval and pupal molting (protein synthesis, quinone tanning in integument, tyrosine metabolism); differentiation of adult structures; diapause termination
29		Gonads	Sex hormones?	
30	Symphyla[3]	Brain-and-cerebral-gland neurosecretory system		Molt inhibition

/1/ Neurosecretion, as used in this column, refers to the presence of special secretory-appearing neurons, regardless of evidence for actual neurohormone production. /3/ Also Chilopoda, Diplopoda, and Pauropoda.

91. ENDOCRINE ORGANS AND HORMONES: INVERTEBRATES

	Phylum and Class	Possible Endocrine Organs or Areas[1]	Possible Endocrine Factors [Chemistry]	Effects
	(A)	(B)	(C)	(D)
	Arthropoda			
31	Onychophora	Neurosecretion in brain, ventral cord, pedal nerves; neurohemal infracerebral organs?		
	Annelida			
32	Hirudinea	Neurosecretion in brain and nerve cord; neurohemal organ at base or posterior surface of brain		Reproduction?
33	Oligochaeta	Same as in Hirudinea		Secondary sex characteristics; gamete maturation; regeneration; pigmentation
34	Polychaeta	Same as in Hirudinea	"Juvenile hormone"	Gonad inhibition; inhibition of heteronereid transformation
35				Regeneration
36	Echiuroidea	Neurosecretion in ventral cord		
37	Sipunculoidea	Neurosecretion in brain; anterior neurohemal area ("finger organs")		Reproduction? Myotropic factor?
	Mollusca			
38	Cephalopoda	Some neurosecretion in brain		
39		Optic glands	Inhibited by light through optic tracts	Stimulation of sexual maturation and gonad development
40	Bivalvia	Neurosecretion in most ganglia		Inhibition of spawning
41	Scaphopoda	Neurosecretion in various ganglia		
42	Gastropoda	Neurosecretion in all ganglia		Gonad development? Water balance.
43		Gonads		Reproductive tract development
44	Aschelminthes[4]	Neurosecretion in cephalic nerve ring		
45	Nemertina	Neurosecretion in brain		Gonad inhibition in female
46		Cerebral organ		Spawning?
47	Platyhelminthes	Neurosecretion in brain	[Water-soluble]	Regeneration
48	Cnidaria	Neurosecretion (diffuse?)		Growth stimulation and inhibition

/1/ Neurosecretion, as used in this column, refers to the presence of special secretory-appearing neurons, regardless of evidence for actual neurohormone production. /4/ Nematoda only.

92. RELATIVE ACTIVITY OF GROWTH REGULATORS: PLANTS

Part I. CELL ELONGATION OF OAT COLEOPTILES

Elongation effect was determined by floating 15 apical sections (3 mm in length) of decapitated *Avena* coleoptiles, 90-92 hours old, on the surface of 25 ml of solution in a covered Petri dish, at 24°C for 24 hours. Where concentrations greater than 10^{-5} *M* were required for an elongation of 0.15 mm, the pH of the solutions was adjusted to 5.6 with NaOH. Activity Index = $\frac{\text{molar concentration of indole-3-acetic acid inducing an elongation of 0.15 mm}}{\text{molar concentration of growth regulator inducing an elongation of 0.15 mm}} \times 100$.

	Compound (A)	Activity Index (B)
	Indole acids

93. ANTIMETABOLITES

	Metabolite	Antimetabolite[1]	Structural Alteration	Alteration Affects
	(A)	(B)	(C)	(D)
1	Acetic acid	Fluoroacetic acid	F for H	....
2	Adenine	Benzimidazole & derivatives	2 C for 2 N; side-chain alterations	Microorganisms, animals
3		Triazolopyrimidines	N for C	Microorganisms, animals
4		Diaminopurine	NH_2 for H	Bacteria, animals
5	α-Alanine	Glycine	H for CH_3	Bacteria
6	β-Alanine	β-Aminobutyric acid	CH_3 for H	Yeast
7		Propionic acid	H for NH_2	Bacteria
8		Asparagine	COOH for H; $CONH_2$ for COOH	Yeast
9	*p*-Aminobenzoic acid	Sulfanilamide & derivatives	SO_2NH_2 or derivatives for COOH	Microorganisms
10		*p*-Aminobenzamide	$CONH_2$ for COOH	Bacteria
11		Carbarsone & related arsenicals	Arsenic for C in a COOH group; derivatives	Microorganisms, animals
12		Phosphanilic acid	PO_3H_2 for COOH	Microorganisms
13		Heterocyclic acids[a]	N or S for C	Bacteria
14		Ring-substituted PAB	Halogen or alkyl for H	Bacteria

/1/ Structural analog. /a/ E.g., 6-aminonicotinic acid.

continued

	Metabolite	Antimetabolite[1]	Structural Alteration	Alteration Affects
	(A)	(B)	(C)	(D)
15	*p*-Aminobenzoic acid	*p*-Aminoacetophenone & derivatives	COR for COOH	Bacteria
16		*p*-Nitrobenzoic acid	NO_2 for NH_2	Bacteria
17	Arginine	Canavanine	O for CH_2	Bacteria
18	Ascorbic acid	Glucoascorbic acid	Addition of CHOH & optical inversion	Animals, liver enzymes
19	Aspartic acid	Hydroxyaspartic acid	OH for H	Bacteria
20		Aspartophenone	C_6H_5 for OH	Bacteria
21	Biotin	Desthiobiotin & derivatives	2 H for S	Microorganisms
22		Biotin sulfone	SO_2 for S	Microorganisms
23		Ureylenecyclohexyl aliphatic acids	2 C for S; derivatives with shorter side chains	Microorganisms
24		Desthioisobiotin	Loss of S, geometric isomerism	Insects
25		Ureylenetetrahydrofuryl aliphatic sulfonic acids	O for S, SO_3H for COOH	Microorganisms
26		Homobiotin	Addition of $-CH_2-$	Microorganisms
27	Choline	Triethyl choline	3 ethyls for 3 methyls	Frog muscle, mice
28	Cocarboxylase	Thiaminethiazole pyrophosphate	Loss of pyrimidine portion	Carboxylase
29	Cytidine	Adenosine	OH for H, loss of imidazole ring	*Neurospora* mutant
30	Desthiobiotin	2-Oxyimidazole aliphatic acids	H for CH_3	Microorganisms
31	Glutamic acid	Methionine sulfoxide	$SOCH_3$ for COOH	Bacteria
32		Hydroxyglutamic acid	OH for H	Bacteria
33		*N*-Alkylglutamines	*N*-Alkyl for OH	Bacteria
34	Guanine	Triazolopyrimidines	N for C	Bacteria
35		Benzimidazole	2 C for 2 N	Microorganisms
36	Histamine	Imidazole & derivatives	Elimination or substitution of part of molecule	Smooth muscle, histamine shock in animals
37		Diphenhydramine	Opening of ring, O for N, alkylation of N, C	Smooth muscle, histamine shock in animals
38		Tripelennamine	Opening of ring, alkylation of N	Smooth muscle, histamine shock in animals
39	Hypoxanthine	Hydroxytriazolopyrimidine	N for C	Bacteria
40	Indoleacetic acid	Phenyl butyric acid	Elimination of N and shift of 1 C	Plants
41		Skatyl sulfonic acid	SO_3H for COOH	Plants
42	Inositol	Hexachlorocyclohexane	6 Cl for 6 OH	Fungi, plants, pancreatic amylase
43	Isoleucine	Leucine	Position isomerism of 1 CH_3	Bacteria
44	Leucine	D-Leucine	Optical inversion	Bacteria
45	Lysine	Arginine	Guanidino for amino, elimination of CH_2	*Neurospora* mutant
46	Methionine	Methoxinine	O for S	Bacteria
47		Ethionine	CH_3 for H	Bacteria and animals
48		Norleucine	CH_2 for S	Bacteria
49	Nicotinic acid (or amide)	Pyridine-3 sulfonic acid or amide	SO_3H for COOH	Microorganisms, animals[3]
50		3-Acetylpyridine	$COCH_3$ for COOH	Animals; not microorganisms
51		5-Thiazole carboxamide	S for CH=CH	Certain bacteria
52	Pantothenic acid	Thiopanic acid (pantoyltaurine) & derivatives	SO_3H and derivatives for COOH	Microorganisms, pantothenate-utilizing enzymes; not animals
53		Pantothenyl alcohol	CH_2OH for COOH	Microorganisms; not animals
54		α- or β-Methyl pantothenic acid	CH_3 for H	Microorganisms
55		Other substituted pantoamides	Alkyl or OH- and NH_2-alkyl for CH_2CH_2COOH	Microorganisms
56		Phenyl pantothenone	COC_6H_5 for COOH	Microorganisms
57		Salicylyl β-alanine	*o*-Hydroxy-benzoyl for pantoyl	Microorganisms
58		γ'-Methyl pantothenic acid	CH_3 for H	Bacteria
59	Phenylalanine	β-Hydroxyphenylalanine	OH for H	Bacteria
60		Thienylalanine	S for CH=CH	Microorganisms, animals
61		Furylalanine	O for CH=CH	Microorganisms
62		Halogenated phenylalanines	Halogen for H	Microorganisms
63	Pimelic acid	2, 4-Dichlorosulfanilidocaproic acid	Dichlorosulfanilide for COOH	Biotin-independent microorganisms

/1/ Structural analog. /3/ Animal alcohol and lactic dehydrogenases, not animals in vivo.

continued

	Metabolite	Antimetabolite[1]	Structural Alteration	Alteration Affects
	(A)	(B)	(C)	(D)
64	Porphyrins[4]	Porphyrins lacking vinyl groups		Bacteria
65	Pteroylglutamic acid	Pteroyltriglutamic acid	Addition of two glutamic acids	Transplanted tumors
66		Xanthopterin	Loss of *p*-aminobenzoyl glutamic acid	Transplanted tumors
67	Pyridoxine	Deoxypyridoxine	H for OH	Microorganisms, animals
68		2-Ethyl-3-amino-4-ethoxymethyl-5-amino-methyl pyridine	CH_3 for H, NH_2 for OH, Et for H	Microorganisms
69	Riboflavin	6,7-Dichlororiboflavin	2 Cl for 2 CH_3	Microorganisms
70		Isoriboflavin	Shift in position of CH_3	Animals; not bacteria
71		Corresponding phenazine	2 C for 2 N, 2 NH_2 for 2 OH	Microorganisms, animals
72		Galactoflavin	Dulcityl for ribityl	Animals
73		Lumiflavin	CH_3 for ribityl	Bacteria
74		Araboflavin	Inversion of position of OH	Animals
75	Succinic acid	Malonic acid	Loss of CH_2	Succinic oxidase
76		Sulfonated succinic acid	SO_3H for H	Succinic oxidase
77	Testosterone	Estradiol	Benzene ring for cyclohexane ring, loss of CH_3	Animals
78	Thiamine	Pyrithiamine	CH=CH for S	Microorganisms, animals
79		Oxythiamine	OH for NH_2	Animals, fish thiaminase
80		Butylthiamine	Butyl for CH_3	Animals
81		Aminobenzyl-methylthiazolium chloride	2 C for 2 N, loss of side chains	Fish thiaminase
82	Thymine	5-Substituted dioxypyrimidines	NO_2 or Br or NH_2 or OH for CH_3	Bacteria
83		2,4-Diamino- or dithiothymine	NH_2 or SH for OH	Bacteria
84	Thyroxine	Ethers of diiodotyrosine	*p*-Nitrobenzyl or *p*-nitrophenylethyl or benzyl for *p*-hydroxydiiodophenyl	Tadpoles
85	α-Tocopherol	α-Tocopherol quinone	Opening of ring by addition of O	Animals
86	Tryptophan	Indole of acrylic acid	Loss of NH_3	Bacteria
87		Naphthylacrylic acid	Loss of NH_3, C=C for N	Bacteria
88		Styrylacetic acid	Loss of NH_2, substitution of aliphatic unsaturated side chain for pyrrole ring	Bacteria
89		Methyltryptophans	CH_3 for H	Bacteria
90		Benzothienylalanine	S for N	Bacteria
91		Indole	Loss of side chain	Bacteriophage plus bacteria
92	Tyrosine	3-Fluorotyrosine	F for H	Rats
93	Uracil	Barbituric acid	OH for H	Bacteria
94		Thiouracil	S for O	Bacteria, plant seed germination
95	Vitamin K	Dicumarol & derivatives	O for C, side-chain alterations	Animals
96		Iodinin	2 N for 2 C, side-chain alterations	Bacteria
97		α-Tocopherol quinone	2 CH_3 for benzene ring	Animals
98		2,3-Dichloronaphthoquinone	2 Cl for alkyl side chains	Microorganisms
99		2-Substituted-3-hydroxynaphthoquinones	OH for H, change in alkyl substituent	Animals; not bacteria
100		Methoxynaphthoquinone	OCH_3 for CH_3	Microorganisms

/1/ Structural analog. /4/ E.g., hematin and protoporphyrin.

Abbreviations: d. = decomposes; s. = soluble; i. = insoluble; sl. = slightly; l. = less;

	Antibiotic (Synonym)	Source	Molecular Formula and Weight	Nature	Crystal Form and Color
	(A)	(B)	(C)	(D)	(E)
1	Actinomycins	*Streptomyces* spp.	Varies with the amino acid content	Chromopeptides differing in amino acid portions of the molecule; usually occur naturally as mixtures of two or more components	Red or yellow-red plates, prisms, or needles
2	Amphotericin B[1]	*Streptomyces nodosus*	$C_{46}H_{73}NO_{20}$; 959 (neut. equiv.)[2]	Amphoteric conjugated heptaene	Deep yellow prisms or needles from dimethyl formamide
3	Bacitracins (Ayfivin)	*Bacillus subtilis, B. licheniformis*	Bacitracins A: $C_{66}H_{103}O_{16}N_{17}S$; 1,470±10% (actual) Bacitracins B: $C_{71}H_{112}O_{17}N_{18}S$	Weakly basic polypeptides	White, highly hygroscopic, amorphous powder
4	Carbomycin[4] (Antibiotic M 4209)	*Streptomyces* spp.	$C_{42}H_{67}NO_{16}$; 842 (calc.); 830-860 (neut. equiv.)	Monobasic macrolide	Slender, white, blunt-ended, needle-shaped crystals; colorless laths from ethanol; rectangular plates from ethanol-water
5	Chloramphenicol (Antibiotic 8-44; Levomycetin; Sintomicetin; Synthomycin)	*Streptomyces venezuelae*; by synthesis	$C_{11}H_{12}N_5O_2Cl_2$; 323 (calc.); 310 (Rast)	Neutral	Colorless, elongated plates or fine needles
6	Colistin[5]	*Bacillus colistinus*	$C_{45}H_{85}N_{13}O_{10}$; 1200±50; about 969 (actual)	Heteromeric decapeptide	Colorless
7	Erythromycin[6] (Erythromycin A)	*Streptomyces erythraeus*	$C_{37}H_{67}NO_{13}$; 733.9 (calc.)	Basic macrolide	White needles
8	Griseofulvin	*Penicillium* spp.; by synthesis	$C_{17}H_{17}O_6Cl$; 309-398 (actual); 352.5 (calc.)	Neutral	Massive colorless rhombic or octahedral crystals from benzene
9	Kanamycins[8]	*Streptomyces kanamyceticus*	Kanamycin A: $C_{18}H_{36}N_4O_{11}$; 427-490 (actual) Kanamycin B: $C_{16}H_{32}N_4O_{10}$; 385-560 (Barger); 463.3 (calc.) Kanamycin C[9]: $C_{18}H_{36}N_4O_{11}$; 415-625 (Barger)	Basic	Base: fine colorless needles Sulfate: small, irregular, white, prismatic crystals after repeated crystallization
10	Neomycins[10]	*Streptomyces* spp.	Complex: $C_{23}H_{46}N_6O_{13}$; 507-669 (ebull.)	Basic	Sulfate, HCl, and free base: colorless amorphous solids
11	Novobiocin	*Streptomyces griseoflavus, S. niveus, S. spheroides*	$C_{31}H_{36}N_2O_{11}$; 592±25 (ebull.); 610 (Rast); 618 (X ray)	Dibasic acid	White to cream-colored amorphous solid or pale yellow crystals (two crystalline forms, I and II)
12	Nystatin (Fungicidin)	*Streptomyces noursei*; other *Streptomyces* species	$C_{46}H_{77}O_{19}$; 933 (calc.)	Amphoteric conjugated tetraene	Pale yellow microcrystals or needles

/1/ The same *Streptomyces* culture produces amphotericin A, a conjugated tetraene antifungal agent [46, 47]. /4/ Carbomycin B occurs in beers of *Streptomyces halstedii* [68]. /5/ Identical with polymyxin E [132]. /6/ Erythpartially resolidifies and then melts at 190-193°C [54]. /8/ A complex of kanamycins A, B, and C [90, 105]. /9/ Isoyears, under refrigeration [21].

CHEMICAL CHARACTERISTICS

v. = very; calc. = calculated; neut. equiv. = neutral equivalent; ebull. = ebullient.

Melting Point °C	Solubility	Stability	Reference	
(F)	(G)	(H)	(I)	
215-255 d.	s. benzene, ethanol acetone; sl.s. water, ether; i. aqueous dilute mineral acids and alkalies, petroleum ether	Thermostable at pH 6-7; relatively stable at acid pH; unstable at alkaline pH	126,127	1
Gradual decomposition above 170	s. dimethyl sulfoxide, acetic *N,N*-dimethylformamide; sl.s. propylene glycol, glacial acetic acid, *N,N*-dimethylformamide; i. water, chloroform, methanol, ether, pyridine, alcoholic KOH[2]	Dry solids stable for long periods at moderate temperatures; undergoes decomposition in solution at pH 4-10	B,46,47;C,E-G, 45;D,H,120	2
	s. methanol, ethanol, water; sl.s. acetone, cyclohexanone, propanols, butanols, pyridine; i. ether, chloroform, benzene, acetone, ethyl acetate, petroleum ether	Relatively thermostable, especially at pH 4 and 5; unstable above pH 9; aqueous solutions unstable after storage at room temperature[3]	B,73;C,29,30;D,9, 28;E,9;G,H,6, 15,73	3
210-218 d.	Acid salts: s. water, most organic solvents Base: i. water, hexane	Most stable at pH 5-7 (11 days at 25°C); stable for several months in dark at room temperature; unstable below pH 3 and above pH 9	B,51,72,115;C,44, 51,72;D,44,51, 115,133;E,51, 115,121;F,H,44, 51,121;G,115,121	4
149.7-150.7	s. propylene glycol, methanol, ethanol, butanol, ethyl acetate, acetone, diethyl ether; sl.s. chloroform, water, alkali; i. acid, benzene, petroleum ether, vegetable oils	Thermostable; alkali labile	B,27,48,80;C,11, 101;D,10,48,60, 101;E,10,48,57;F,10,11,48, 57,101;G,10,48,57,60,101; H,10,11,48,57	5
Base: 245-249 d. Phosphate: 145	s. water, lower alcohols	Stable at 40°C for at least 60 days; salt solutions stable at pH 2-6, less stable above pH 6	B,E,F,79;C,G,79, 106;D,33	6
Complex: 82-83.5 Base: 136-140[7] HCl: 170-173	s. alcohols, acetone, chloroform, acetonitrile, ethyl acetate; l.s. ether, ethylene dichloride, amyl acetate, water HCl: v.s. water, lower alcohols	Stable at -25° to +4°C; stable 4 days at 37°C; unstable at 60° or 100°C	B,84;C,130;D,84, 130;E,F,54;G,54, 84;H,62	7
220-221	s. *N,N*-dimethylformamide 12-14% at room temperature, acetic acid, dioxane, benzene, ether, ethanol; sl.s. chloroform, ethyl acetate, toluene, acetone, ligroin; i. water, petroleum ether	Thermostable	B,20,35,116,118; C,59,93;D,E,93; F,59;G,8,93;H, 18	8
Decompose over a wide range	Base: s. water; sl.s. lower alcohols; i. nonpolar solvents HCl: v.s. water; s. methanol; sl.s. ethanol; i. acetone, ethyl acetate, butyl acetate, ether, benzene	Thermostable, especially at neutral pH	B,119;C,32,85,89, 122;D,32;E,32, 89,122;F,32,90, 105,122;G,32, 105,122;H,31,58	9
	s. water; i. organic solvents	Thermostable; crude neomycin stable at pH 2-9; highly purified preparations stable to alkali only	124,125	10
I: 152-156 d. II: 174-178 d.	s. methanol, ethanol, butanol, acetic acid, dioxane, water above pH 7.5; i. water below pH 7.5, ether, benzene, carbon tetrachloride, chloroform Mono- and di-sodium salts: v.s. water	Dry material stable at 24°C in absence of light; dilute aqueous solutions stable at pH 2 at 24°C; half-life, 60 days at pH 7-10	B,111,128;C,67, 69,74;D,F,69,74; E,69,74,88;G,88; H,70	11
Gradual decomposition above 160 without melting at 250	s. *N,N*-dimethylformamide, *N,N*-dimethylacetamide, propylene glycol; l.s. methanol, aqueous *n*-propanol or isopropanol, water-saturated butanol; i. water, most organic solvents	Unstable; most stable as a dry powder[11]; aqueous suspensions less stable than alcoholic solutions; aqueous suspensions stable at least eight months at -25°C	B,65;C,G,21;D,F, 107;E,43	12

/2/ Perchloric acid in acetic acid [45]. /3/ Bacitracin F, a transformation product, is formed above pH 7 [30, 64]. romycins B and C also occur in same fermentation liquors [131]. /7/ If slow rate of heating continues, compound meric with kanamycin A [89]. /10/ A complex of neomycins B and C which are isomeric [125]. /11/ At least 4½

	Antibiotic (Synonym)	Source	Molecular Formula and Weight	Nature	Crystal Form and Color
	(A)	(B)	(C)	(D)	(E)
13	Oleandomycin (Antibiotic PA 105)	*Streptomyces antibioticus*	$C_{35}H_{61}NO_{12}$; 715 (ebull.); 687.84 (calc.)	Basic macrolide	Long white needles; colorless prisms
14	Paromomycin (Aminosidin; Catenulin; Hydroxymycin)	*Streptomyces* spp.	$C_{23}H_{45}N_5O_{14}$	Basic	Amorphous; white
15	Penicillins			Strong monobasic carboxylic acid	
16	Ampicillin	Semisynthetic	$C_{16}H_{19}N_3O_4S$		Fine needles
17	Benzylpenicillin (Penicillin G)	*Penicillium* spp.; *Aspergillus* spp.	$C_{16}H_{18}N_2O_4S$; 331 (actual)		Colorless prisms
18	Cephalosporin N (Penicillin N; Synnematin B)	*Cephalosporium* spp.; *Streptomyces* sp.	$C_{14}H_{21}N_3O_6S$	A hydrophilic penicillin	Ba salt; white powder
19	Methicillin	Semisynthetic	Sodium salt: $C_{17}H_{19}N_2O_6SNa$		White crystalline solid
20	Oxacillin	Semisynthetic	Sodium salt: $C_{19}H_{18}N_3O_5SNa$		
21	Phenethicillin	Semisynthetic	Potassium salt: $C_{17}H_{19}N_2O_5SK$; 402.51		Colorless crystals
22	Phenoxymethylpenicillin (Penicillin V)	*Penicillium notatum*	Potassium salt: $C_{16}H_{17}N_2O_5SK$		
23	Polymyxins	*Bacillus polymyxa*	Polymyxin $B_1 \cdot 5HCl$: $C_{56}H_{104}N_{16}O_{14}Cl_5$; 1,150±10% (actual) Polymyxin D·4HCl: $C_{50}H_{97}N_{15}O_{15}Cl_4$; 1,150 (actual); 1,144 (calc.) Average for A, B, D, E: 1,250 (actual)	Basic polypeptides	Birefringent; no definite structure
24	Ristocetins[12]	*Nocardia lurida*	Ristocetin A: 2,500 (freezing point depression); 5,000 (ultracentrifuge)	Amphoteric	A sulfate: hexagonal prismatic rods B sulfate: needles
25	Spiramycins[13] (Antibiotic R.P. 5337; Foromacidins; Sequamycin)	*Streptomyces ambofaciens*	I: $C_{45}H_{78}N_2O_{15}$; 886 (calc.) II: $C_{47}H_{80}N_2O_{16}$; 928 (calc.) III: $C_{48}H_{82}N_2O_{16}$; 942 (calc.)	Basic macrolides	Complex: amorphous white powder
26	Streptomycin	*Streptomyces* spp.	$C_{21}H_{39}N_7O_{12}$; 581.58 (calc.)	Strongly basic	Reineckate: thin plates Helianthate: dark red crystals HCl: white amorphous powder Tri-HCl: monoclinic prisms
27	Streptovaricin[14]	*Streptomyces spectabilis*			Partially crystalline; bright orange-yellow

/12/ Two components distinguishable by paper chromatography; B is three-to-four times as active as A [98]. /13/ The five components [110].

Melting Point °C	Solubility	Stability	Reference	
(F)	(G)	(H)	(I)	
Base: 110 d. Chloroform solvate: 120-121	Base: s. most organic solvents, acidic media; sl.s. water, ligroin HCl: v.s. water	Stable at room temperature pH 2-9 in aqueous solution; unstable when heated at acid pH	B,112;C,49,72,113;D,49,72;E,49,113;F,G,49;H,112,113	13
	v.s. water; l.s. methanol; sl.s. absolute ethanol; i. other organic solvents	Stable in aqueous solutions at pH 1.5-10.0	B,7,55,61;C,D,7,104;E,55;G,7,55;H,34	14
	Acids: s. alcohols, ketones, ethers, esters, aromatic hydrocarbons; sl.s. water; i. aliphatic hydrocarbons Na salts: s. water, methanol, ethanol; sl.s. dry butanol, ketones, ethyl acetate		24,53	15
202 d.	Free acid: sl.s. water; more s. in alkaline solutions	Acid stable; unstable to penicillinase	B,C,E,F,39;G,H,77	16
Na salt: 215 d.		Labile to acids, heat, penicillinase	24,53	17
	i. most organic solvents Ba salt: s. water; sl.s. methanol; i. ethanol	Unstable at room temperature below pH 4 and above 9; unstable at pH 7 in presence of heavy metal ions; unstable to penicillinase	B,D,1,3;C,1,91;E,2;G,2,3;H,3,91	18
		Unstable to acid; stable to penicillinase	B,H,37,76,77;C,37;E,37,103	19
Hydrated Na salt: 188 d.		Acid stable; stable to penicillinase	38	20
K salt: 230-231 d.		Acid stable; unstable to penicillinase	B,C,78,97;E,F,97;H,78	21
K salt: 263 d.		Acid stable; unstable to penicillinase	B,53,95;C,109;F,108;H,56,95	22
228-235 d.	Base: sl.s. water; i. alcohol HCl: s. water, methanol; l.s. higher alcohols; i. ether, esters, hydrocarbons, chlorinated solvents	Thermo- and acid-stable; alkali unstable	B,4;C,14,50,63;D,22;E,100;F,G,14,23;H,23	23
	s. acidic aqueous solution; l.s. at neutral pH; i. organic solvents Bases are less water-soluble than salts	Stable at acid pH; unstable at alkaline pH	98	24
I: 134-137 II: 130-133 III: 128-131	Base: s. most organic solvents; sl.s. water Sulfate: s. water, lower aliphatic alcohols	Biological activity lost on acid hydrolysis	B,E,G,99;C,72,96;D,72,99;F,H,96	25
Reineckate: 164-165 d. Helianthate: 220-226 d. Tri-HCl: gradual decomposition without melting	s. water; sl.s. lower alcohols; i. other organic solvents	Stable at pH 3-7; less stable to heat, acid, alkali	123	26
144-147 d.	v.s. *N,N*-dimethylformamide, 95% ethanol; s. methanol, butanol, lower ketones, methylene chloride, chloroform, lower acetates; sl.s. water; i. hexane, ether, carbon tetrachloride, benzene	Biological activity destroyed in alkaline solution	B,110;E-H,129	27

three components I, II, and III are identical with foromacidins A, B, and C [96]. /14/ A complex containing at least

ANTIBIOTICS

CHEMICAL CHARACTERISTICS

Melting Point °C	Solubility	Stability	Reference	
(F)	(G)	(H)	(I)	
Base: 168-169 d. HCl: decomposes above 210	Base: v.s. aqueous solutions above pH 8.5, dioxane, pyridine, cellosolves, carbitol; l.s. methanol, ethanol, butanol, acetone, ethyl acetate, benzene; i. ether, petroleum ether HCl: s. water, methanol; sl.s. ethanol	Most stable at pH 2.5; less stable at neutral and alkaline pH	B,41;C,114;D,19, 25,42,102;E,42; F,G,19,42;H,36, 52,102	28
Base: 170-175 d. Sesquihydrate: 174-178 d.	More water-soluble than other tetracyclines	More stable than other tetracyclines at acid pH, and oxytetracycline and chlortetracycline at alkaline pH	B,F,81,82;C,E,G, H,82;D,19,25,42, 102	29
Anhydrous base: 184.5-185.5 d. Dihydrate: 181-182 HCl: 190-194	Anhydrous base: s. methanol, ethanol, acetone, propylene glycol, dioxane; sl.s. water, butanol, 90% aqueous acetone, 95% methanol; i. ether, petroleum ether HCl: s. acetone, methanol, ethanol, other polar organic solvents; i. ether, petroleum ether	Most stable at pH 2.5; less stable at neutral and alkaline pH	B,52,117;C,102;D, 19,25,42,102; E-G,52,102;H, 36,52,102	30
Anhydrous base: 160-168 Trihydrate: 170-175 d. HCl: 214 d.	Trihydrate: v.s. methanol; s. ethanol, butanol, ethyl acetate, chloroform; sl.s. water, benzene, ether; i. petroleum ether HCl: s. water; l.s. methanol, ethanol; i. ether, hydrocarbons	More stable than chlortetracycline and oxytetracycline; most stable at acid pH	B,25,86,114;C,25, 26;D,19,25,42, 102;E,5,87;F,17, 25,26;G,16;H,86	31
228-248 (depends on last solvent present during drying)	s. chloroform, benzene, ethanol, acetone, hot ethyl acetate, 10% HCl; sl.s. water, ether; i. petroleum ether, dilute mineral acids, dilute alkali	Thermostable	B-E,G,H,71;F,92	32
240 d.	s. methanol, ethanol, acetic acid, pyridine (especially in presence of water); sl.s. water, dry acetone, dioxane; i. ether, hydrocarbons, chloroform, electrolytes	Thermostable	B,F-H,71;C,13, 75,94;D,E,12; F-H,71	33
	HCl: s. water; l.s. aqueous methanol; i. higher alcohols, acetone, ether	Most stable at pH 3-5; unstable at 37°C in glycine buffer at other than pH 3-5; 10% loss in six months at 5°C and pH 3-5	B,D,G,83;C,H,66; E,66,83	34

Bacillus brevis is source of tyrothricin [40].

Part II. BIOLOGICAL ACTIVITY

	Antibiotic	Biological Activity	Clinical Results
	(A)	(B)	(C)
1	Actinomycins	**In vitro**: Inhibitory to gram-positive bacteria; less active against mycobacteria; virtually inactive against gram-negative bacteria and fungi. **In vivo**: Effectiveness in animals is limited by high toxicity, but there are several reports of activity on tumors. Many actinomycins cause splenic atrophy in animals after multiple doses. [54]	Short remissions have been obtained in Hodgkin's disease and chronic lymphatic leukemia with actinomycin C. Diarrhea, mucosal inflammation, alopecia, and liver damage have been noted. [3] Actinomycin D has produced a number of temporary remissions in carcinoma of the breast, malignant melanoma, and lymphosarcoma. Toxicity is similar to that produced with actinomycin C. [51]
2	Amphotericin B	**In vitro**: An antifungal agent which is most active against fungi possessing a yeast phase (apparently acts against oxidative metabolic processes). Activity, which is markedly influenced by pH, is reduced above pH 7.5. Inhibits *Blastomyces dermatitidis, Candida albicans, Cladosporium trichoides, Coccidioides immitis, Cryptococcus neoformans, Histoplasma capsulatum, Paracoccidioides brasiliensis* and the yeast phase only of *Sporotrichum schenckii*. **In vivo**: Biological cures have been limited mostly to cases in which drug administration occurred with, or shortly after, inoculation. [34,43,47]	Useful in treating such systemic mycoses as histoplasmosis, blastomycosis, coccidioidomycosis, and cryptococcosis. Usefulness in moniliasis has not been adequately established. Preferred route of administration is intravenous, but intrathecal or local instillations may be employed. Poor absorption from the gastrointestinal tract precludes oral administration. Mild reversible azotemia, anorexia, headache, chills and fever are common toxic manifestations. Other effects include anemia, intestinal disturbance, and rash. [34,43,47]
3	Bacitracins	**In vitro**: In general, active against gram-positive bacteria (especially micrococci); little or no activity against gram-negative organisms, *Bacillus subtilis*, or fungi. Little evidence of cross-resistance with other antibiotics. Bactericidal. **In vivo**: Controlled staphylococcal meningitis in dogs, *Treponema pallidum* in rabbits, clostridial infections in guinea pigs (if promptly administered), and pinworms in mice. [13,31]	Used in the topical therapy of superficial infections of the skin, mucous membranes, eye, ear, etc. Frequently combined with polymyxin or neomycin for specific drug-resistant staphylococcal sepsis. Amoebic colitis, dysentery due to various organisms, and pinworms treated successfully by oral administration. Nephrotoxicity and pain at site generally result from parenteral treatments. [13,23]
4	Carbomycin	**In vitro**: Bacteriostatic. Active mainly against gram-positive and a few gram-negative bacteria, large viruses, rickettsiae, and certain protozoa. Cross-resistance with erythromycin and other macrolides. *continued*	Useful in infections caused by gram-positive organisms resistant to penicillin, but seems to have no advantage over erythromycin in common pyogenic infections. Usually administered orally. Low toxicity, similar to that produced by erythromycin. [4,13]

continued

94. ANTIBIOTICS

Part II. BIOLOGICAL ACTIVITY

	Antibiotic (A)	Biological Activity (B)	Clinical Results (C)
	Carbomycin (*See* preceding page)	**In vivo**: Good protection against *Diplococcus pneumoniae, Staphylococcus aureus, Pasteurella multocida, Clostridium tetani*, many rickettsiae, the viruses of psittacosis, ornithosis, lymphogranuloma venereum, human and feline pneumonitis, and sporadic encephalomyelitis. Inactive against *Bacillus anthracis, Mycobacterium tuberculosis*. [13]	
5	Chloramphenicol	**In vitro**: Inhibits protein synthesis and is primarily bacteriostatic. Active against gram-positive and gram-negative bacteria, rickettsiae, and large viruses; no activity against fungi. Active against *Borrelia* spp., *Entamoeba histolytica, Tritrichomonas foetus*. **In vivo**: Active in a wide variety of infections caused by the organisms specified under "in vitro." [21,56]	Agent of choice in typhoid fever and some types of meningitis, notably *Haemophilus influenzae* meningitis. Commonly used in systemic infections caused by staphylococci, particularly those resistant to other drugs. Useful in treating rickettsial diseases, infections caused by resistant gram-negative enteric bacteria, and severe dysenteries. Administered orally or parenterally. Toxic manifestations have included gastrointestinal upset, hypersensitivity, and blood dyscrasias. [21,56]
6	Colistin	**In vitro**: Primarily bactericidal. Highly inhibitory for most strains of the coli-aerogenes, *Pseudomonas, Salmonella*, and *Shigella* groups, being more active than polymyxin B. Inhibits some species of *Candida* and certain other fungi. Most strains of *Proteus, Neisseria*, and gram-positive organisms are resistant. **In vivo**: Colistinmethanesulfonate is less toxic in mice, but not in rats, than the sulfate. Both compounds are highly effective orally or parenterally against *Escherichia coli* or *Klebsiella pneumoniae* infections in mice. [42,57]	Colistin sulfate, administered orally, is particularly effective in infectious infant enteritis. Intramuscular administration of colistinmethanesulfonate has given encouraging results in pertussis, influenza, meningitis, urinary tract infections, gram-negative septicemias, and endocarditis when caused by sensitive organisms. The most potentially serious toxic effect is renal damage. [35,41]
7	Erythromycin	**In vitro**: Bacteriostatic. Active primarily against gram-positive bacteria, but a few gram-negative organisms, certain rickettsiae, and large viruses are also susceptible. Active against *Entamoeba histolytica* and *Trichomonas vaginalis*. **In vivo**: Good protection in infections produced by gram-positive organisms, large viruses, rickettsiae, oxyurids, and *E. histolytica*. Rapid increase in resistance noted. Cross-resistance to a varying degree with other macrolides. [13,18]	Effective in streptococcal, pneumococcal, and staphylococcal infections, especially those caused by strains resistant to penicillin. Useful in patients allergic to penicillin. Occasional use in *Haemophilus* infections, venereal diseases, pertussis, diphtheria, and amoebiasis. Usually administered by the oral route. Has a low order of toxicity, but gastrointestinal side effects limit high oral dosage. Jaundice has occasionally been observed. [13,18]
8	Griseofulvin	**In vitro**: An antifungal agent with no activity against bacteria. The majority of fungi are sensitive, including most human pathogens, notable exceptions being *Candida albicans, Saccharomyces cerevisiae, Torulopsis utilis*, and oomycetes. Mycostatic. **In vivo**: When administered orally, active in dogs and guinea pigs infected with *Trichophyton rubrum* and *Microsporum canis*. Presence of griseofulvin in hair shafts was demonstrated. [8,28]	Oral administration useful in the treatment of superficial infections of the hair, nails, and skin. Localizes and concentrates in these keratinized tissues. Cures may require long, continued dosage. Ineffective in deep mycoses. Very low toxicity, but occasional mild gastrointestinal upset, diarrhea, headache, and drug rashes may occur. [8,28,40]
9	Kanamycins	**In vitro**: Bactericidal. Active against most strains of staphylococci, *Vibrio, Salmonella, Shigella*, mycobacteria, coliforms, *Proteus*, and some strains of *Pseudomonas*. Inactive against streptococci, pneumococci, anaerobes, yeasts, and fungi. Some cross-resistance with paromomycin and neomycin, less cross-resistance with streptomycin. **In vivo**: Effective in protecting mice against *Klebsiella pneumoniae, Diplococcus pneumoniae, Proteus vulgaris*, and *Staphylococcus aureus*; no protection against virulent strains of *Streptococcus pyogenes*. Active against tuberculosis in guinea pigs. [17,22,58-60]	Useful in infections caused by staphylococci, *Escherichia coli, Proteus, Klebsiella*, and some strains of *Pseudomonas*. Therapy usually correlates well with sensitivity tests. Used orally to obtain preoperative sterilization of the bowel. Commonest parenteral administration is by the intramuscular route. Usefulness in tuberculosis is limited by rapid development of resistance and by ototoxicity. Other side effects include nephrotoxicity, eosinophilia, pain at site of injection, and rashes. The kanamycin in present use is primarily A, which is less toxic than B. [59,60]

continued

94. ANTIBIOTICS

Part II. BIOLOGICAL ACTIVITY

	Antibiotic	Biological Activity	Clinical Results
	(A)	(B)	(C)
10	Neomycins	**In vitro**: Bactericidal. Active primarily against gram-positive cocci, gram-negative rods, acid-fast bacilli, and actinomycetes. More active against staphylococci than streptococci. Little or no activity against yeasts, filamentous fungi, viruses, or protozoa. **In vivo**: Protected mice and chick embryos from lethal doses of *Staphylococcus aureus* and *Salmonella typhosa*; effective in tuberculosis in guinea pigs, and in *Klebsiella pneumoniae*, *Proteus vulgaris*, *Pseudomonas aeruginosa*, and cholera infections in mice. [13,53,60]	Employed orally for preoperative bowel preparation, management of liver failure, and management of gastroenteritis due to *Escherichia coli*. A topical solution or ointment is used for superficial infections. Not used parenterally. Intraperitoneal or intrapleural injections may cause respiratory arrest or insufficiency. Ototoxic and nephrotoxic. Oral treatment may cause gastrointestinal distress. [13,53,60]
11	Novobiocin	**In vitro**: Bactericidal. Staphylococci, including strains resistant to other antibiotics, are uniformly susceptible. Streptococci, while generally sensitive, are more variable. Gram-negative bacteria, except for strains of *Haemophilus*, are generally insensitive. Activity reduced in presence of serum. Rapid induction of resistance. **In vivo**: Protected mice in acute and chronic staphylococcal infections, but less active than erythromycin in streptococcal and pneumococcal infections. Also active in mice against *Pasteurella multocida*, *Proteus vulgaris*, and *Haemophilus influenzae*. No activity in tuberculosis, or in fungal, rickettsial, and viral infections. [13]	Primary use in staphylococcal pyodermas insensitive to other antibiotics; some usefulness in pneumococcic pneumonia, undulant fever, and in genitourinary infections due to *Proteus*, *Staphylococcus aureus*, or *Streptococcus faecalis*. Calcium and sodium salts absorbed via the oral route (the route commonly used). Much patient-to-patient variation in serum binding; the dosage therefore is determined on an individual basis. Tendency for resistant strains to appear in clinical practice. Skin rash, urticaria, drug fever, and occasional leucopenia may be noted. Very high doses may induce liver damage. [13,37]
12	Nystatin	**In vitro**: Fungistatic and fungicidal. Active against most fungi, including *Candida albicans* and species of *Blastomyces*, *Coccidioides*, *Cryptococcus*, *Epidermophyton*, *Histoplasma*, *Microsporum*, and *Trichophyton*. Affects production of certain enzymes by sensitive organisms; also affects cell permeability. Has laboratory use in controlling yeast and mold contaminations in biological samples, culture media, tissue cultures, etc. **In vivo**: Protected mice infected with strains of *Candida* or *Histoplasma*. [13,20]	Effective against various forms of moniliasis when administered by the topical or oral routes, by inhalation, or by local injection. Frequently used prophylactically with broad spectrum antibacterial antibiotics. Oral use curtailed by poor absorption. Temporary gastric upset may occur with oral treatment, and severe toxicity with injection. [13,20]
13	Oleandomycin	**In vitro**: Bacteriostatic. Mostly active against gram-positive bacteria. Gram-negative activity limited to *Haemophilus*, *Brucella*, and *Neisseria*. Cross-resistant with erythromycin and other macrolides. **In vivo**: Good therapeutic activity in mice against *Streptococcus pyogenes* and *Staphylococcus aureus*. [14,48]	Employed in infections caused by gram-positive cocci, especially in cases of penicillin sensitivity. Administered orally or intravenously. Triacetyloleandomycin has similar use and is pharmacologically superior, but is not suitable for parenteral injection because of low solubility. Toxicity is mostly confined to gastrointestinal distress. [14]
14	Paromomycin	**In vitro**: Bactericidal and bacteriostatic. Broad spectrum of activity against gram-positive and gram-negative organisms and mycobacteria. Moderate activity against *Vibrio comma*, nonmammalian mycobacteria, and *Shigella* spp. Inactive against *Pseudomonas aeruginosa*. **In vivo**: Especially effective against staphylococci and gram-negative bacilli in experimental mouse infections. Moderately tuberculostatic when given parenterally to mice and guinea pigs. Effective in amoebic infections in dogs and rats. [11,44]	Oral form is used for chronic and acute intestinal amoebiasis, enteric bacterial infections, preoperative bowel treatment, and management of hepatic coma. May exert a mild laxative side effect. Nephrotoxic when administered parenterally. [44,60]
	Penicillins		
15	Ampicillin	**In vitro**: Slightly less active than penicillin G against pyogenic cocci. Active against many gram-negative bacteria, including *Escherichia coli*, *Haemophilus influenzae*, *Salmonella* spp., *Shigella* spp.; *Proteus* activity varies with the	Efficacious in acute and chronic respiratory infections, in many urinary infections, and in peritonitis and wound infections. May be useful in cholecystitis, meningitis, and endocarditis, especially when caused by streptococci of

continued

94. ANTIBIOTICS

Part II. BIOLOGICAL ACTIVITY

	Antibiotic (A)	Biological Activity (B)	Clinical Results (C)
	Ampicillin (*See* preceding page)	strain. Inactive against *Aerobacter aerogenes*, *Pseudomonas pyocyanea*, and staphylococci resistant to penicillin G. **In vivo**: Stable in acid medium and well-absorbed orally. Active in animals against infections produced by sensitive organisms. [26,50]	group D. Use in infections from *Proteus* and coliforms should be governed by sensitivity tests. Can be given orally or intramuscularly. Nontoxic but is cross-allergenic with other penicillins. [50]
16	Benzylpenicillin (Penicillin G)	**In vitro**: Bactericidal. In general, highly active against gram-positive bacteria. Most strains of the following are sensitive to low concentrations: *Bacillus*, *Clostridium*, *Corynebacterium*, *Diplococcus*, *Micrococcus*, *Streptococcus*, *Actinomyces*, *Borrelia*, *Leptospira*, and *Treponema*. With the exception of *Haemophilus* and *Neisseria*, most gram-negative bacteria are not sensitive. Inactive against *Mycobacterium* spp., pleuropneumonia-like organisms, yeasts, fungi, viruses, rickettsiae, protozoa. Resistance develops in a slow, stepwise manner. Destroyed by penicillinase (organisms producing penicillinase are resistant). **In vivo**: Activity in experimental infections in general follows the "in vitro" antimicrobial spectrum. [5,12]	Drug of choice in infections caused by all strains and species of *Streptococcus*; pneumococci; nonpenicillinase-producing strains of staphylococci; gonococci; spirochetes, *Borrelia*, and spiral organisms of the mouth; clostridia; *Corynebacterium*; and anthrax. Aqueous, crystalline penicillin G is used for rapid effect or high serum concentrations. For longer-lasting activity (e.g., in prophylaxis of rheumatic fever or glomerulonephritis), procaine (or benzathine) penicillin G is administered intramuscularly. Usefulness limited by allergenic reactions, sensitivity to penicillinase, and acid instability which precludes oral dosage. [5,30]
17	Cephalosporin N	**In vitro**: Bactericidal. Less active than other important penicillins against gram-positive bacteria, but shows good activity against many gram-negative bacteria, its activity against *Salmonella* being more than tenfold that of penicillin G. **In vivo**: Protected mice from infection with *Salmonella typhimurium*, *S. typhosa*, *Escherichia coli*, *Proteus vulgaris*, and *P. mirabilis*, and chicks with *S. pullorum*. Activity in vivo sometimes greater than is indicated by "in vitro" tests. [1]	Effective in limited trials in the treatment and control of typhoid fever in man. Has also been used for the treatment of gonorrhea and syphilis in patients sensitive to penicillin G. [1]
18	Methicillin	**In vitro**: Bactericidal. As active as penicillin G against penicillin-sensitive, or resistant, staphylococci. Less active against streptococci. **In vivo**: Activity corresponds to that indicated in "in vitro." [26]	Particularly useful in infections caused by penicillin-resistant staphylococci. Must be administered parenterally. Low toxicity, but shows complete cross-allergenicity with other penicillins. [26]
19	Oxacillin	**In vitro**: Activity resembles that of methicillin, but oxacillin is five-to-eight times more active against resistant staphylococci. **In vivo**: Resembles penicillin V in stability, absorption, and serum level, but oxacillin binds more readily to serum than any other available penicillin. [2,25]	As useful as methicillin in same types of infections, but oxacillin is resistant to acid and therefore is an effective oral antibiotic against resistant staphylococci. [2,25]
20	Phenethicillin	**In vitro**: Has spectrum similar to that of penicillin V. **In vivo**: As active as penicillin V against *Diplococcus pneumoniae* and *Streptococcus pyogenes* infections, and more active against *Staphylococcus aureus* infections. Not active against strains resistant to penicillin G. [16]	A penicillin capable of being administered orally. Its use parallels that of penicillin V, but phenethicillin is reported to give higher and more constant blood-level concentrations than does potassium penicillin V. [32]
21	Phenoxymethylpenicillin (Penicillin V)	**In vitro**: Spectrum of activity is the same as for penicillin G, but V is more stable at pH of less than 6.5. **In vivo**: Protection in pneumococcal and other infections equivalent to that produced by penicillin G. Acid stability permits good protection via the oral route. [7,9]	Range of activity in treating various infections is comparable to that of penicillin G.. Has the advantage of oral administration. [7,9]
22	Polymyxins	**In vitro**: Bactericidal. Active mainly against gram-negative bacteria, including *Pseudomonas*. *Proteus* strains are often resistant. Little or no activity against fungi. **In vivo**: Good protection in mice infected with	Used mainly in serious infections due to *Pseudomonas aeruginosa*, such as urinary tract infections and meningitis. Effective in gram-negative infections of body surfaces (eye, ear, skin wounds) and of body spaces (joint, pleural,

continued

94. ANTIBIOTICS

Part II. BIOLOGICAL ACTIVITY

	Antibiotic	Biological Activity	Clinical Results
	(A)	(B)	(C)
	Polymyxins (*See* preceding page)	*Salmonella typhosa, Bordetella pertussis,* and *Klebsiella pneumoniae*, and in chicks infected with *Pasteurella multocida* and *S. gallinarum*. No protection against streptococci and staphylococci. [13,23]	dural). Used topically or by mouth, as in *Salmonella enteritis*. Often combined with other drugs. Parenteral use may cause neuro- and nephro-toxicity, pain at site of injection, fever, and rashes. [13,23]
23	Ristocetins	**In vitro:** Bactericidal and bacteriostatic. Specifically active against gram-positive bacteria and mycobacteria; inactive against gram-negative bacteria (including *Haemophilus influenzae* and *Neisseria* spp.), yeasts, filamentous fungi, and protozoa. No cross-resistance with other antibiotics. **In vivo:** Controlled infections of mice caused by *Streptococcus pyogenes, Staphylococcus aureus*, and *Diplococcus pneumoniae*. Not effective against tuberculosis in mice. [19,39]	Most useful in severe staphylococcal and enterococcal infections resistant to other antimicrobials. Useful in short-term therapy of enterococcal endocarditis. Only administered intravenously. Toxicity is directly related to size of dosage and may include disturbances of the hematopoietic system, phlebitis, fever, and rash. [39]
24	Spiramycins	**In vitro:** Bacteriostatic. Especially active on gram-positive bacteria and to a lesser extent on mycobacteria and some gram-negative bacteria. Active on rickettsiae. Cross-resistance with other macrolides. **In vivo:** Protected mice infected with hemolytic streptococci, pneumococci, and staphylococci. Activity in vivo is greater than is indicated by "in vitro" tests. [13,36]	Active in various staphylococcal infections; particularly useful against organisms resistant to other antimicrobials. Promising results in gonococcal infections. Orally administered. Toxicities are very low or nonexistent. [13]
25	Streptomycin	**In vitro:** Bactericidal. Active against gram-positive and gram-negative bacteria, including mycobacteria. No activity against fungi, rickettsiae, or viruses. Rapid development of resistance. **In vivo:** Excellent protection in a wide variety of experimental infections, including *Bacillus anthracis, Brucella abortus, Diplococcus pneumoniae, Mycobacterium tuberculosis, Neisseria meningitidis, Pasteurella pestis, P. tularensis, Staphylococcus aureus, Streptococcus pyogenes,* and species of *Haemophilus, Klebsiella, Pseudomonas, Salmonella, Shigella*. [45,52]	Often combined with bacteriostatic agents, such as one of the tetracyclines or sulfonamides, chloramphenicol, etc. Is used alone or in combination against tuberculosis, *Haemophilus influenzae* meningitis, subacute bacterial endocarditis, tularemia, plague, *Klebsiella pneumoniae*, or *Escherichia coli* infections. Parenteral or topical application. Use in tuberculosis is limited by rapid development of resistant strains. May cause ototoxicity, but is less likely to do so than dihydrostreptomycin or a combination of the two. [45,52]
26	Streptovaricin	**In vitro:** The streptovaricin complex and components A, B, and C are very active against gram-positive bacteria and mycobacteria, and show activity against some gram-negative bacteria and fungi. Components D and E have only low activity against gram-positive bacteria. **In vivo:** Highly effective in the tuberculous mouse, component C being the most active. Effectiveness increased when combined with isoniazid. [29,38,46]	Only slight improvement in patients with advanced pulmonary tuberculosis when administered orally (50 mg/kg daily dosage). Some gastrointestinal upset observed. Results when combined with isoniazid were not superior to those with isoniazid alone, and were inferior to isoniazid-pyrazinamide treatment. [6,29]
27	Tetracyclines[1]	**In vitro:** Bacteriostatic. Broad spectrum of activity against gram-positive and gram-negative bacteria. Also active against coccidia, amoebae, and balanthidia. Superior to penicillin against *Bacillus anthracis*. Effective against rickettsiae and larger viruses. No activity against fungi. Resistance does not develop readily, but there is almost complete cross-resistance among the four major tetracyclines. **In vivo:** Good protection in laboratory animals against sensitive microorganisms in the groups listed under "in vitro." Little or no protection against *Mycobacterium tuberculosis*. No activity against small viruses or fungi. [8,10,27,33,49]	The commercially available tetracyclines are useful in infections caused by a wide range of microorganisms, including group A streptococci, staphylococci, pneumococci, meningococci, *Bacillus anthracis, Haemophilus influenzae, Bordetella pertussis, Entamoeba histolytica,* rickettsiae, and viruses of the lymphogranuloma-psittacosis group. Toxicity is very low and primarily confined to gastrointestinal upset, although a phototoxic reaction has been reported for demethylchlortetracycline. Dosage is usually via the oral route, although parenteral injection or topical application may be used as required. [8,10,27,33,49]

/1/ Chlortetracycline, demethylchlortetracycline, oxytetracycline, and tetracycline.

continued

94. ANTIBIOTICS

Part II. BIOLOGICAL ACTIVITY

	Antibiotic	Biological Activity	Clinical Results
	(A)	(B)	(C)
28	Tyrothricin[a]	**In vitro**: Tyrothricin is a mixture of approximately 20% gramicidin (the active component) and 80% tyrocidine. It is bacteriostatic at low concentrations and bactericidal at high (1.0 µg/ml, or more). Active against corynebacteria, diplococci, staphylococci, streptococci, lactobacilli, and some fungi. **In vivo**: Tyrocidine loses most of its antibacterial activity in the presence of animal tissues, although it shows some effect against gram-negative cocci. Tyrothricin gives protection against pneumococci, streptococci, and staphylococci, but produces hemolysis and acute lethal toxicity upon injection. [55]	Tyrothricin is employed as a solution, spray, or in troches against sensitive gram-positive bacteria. Sometimes combined with bacitracin. The toxicity of the antibiotic precludes parenteral use. Since it is effective only when in direct contact with microorganisms, it is of little or no value in deep-seated infections. [55]
29	Vancomycin	**In vitro**: Bactericidal. Uniformly active against pathogenic staphylococci. Also inhibits hemolytic streptococci, pneumococci, enterococci, gonococci, corynebacteria, and clostridia. Not active against most gram-negative bacteria, mycobacteria, fungi, and yeasts. Unaffected by serum and by pH of the test medium. Resistance develops slowly, and there is no cross-resistance with other antibiotics. **In vivo**: Mice received complete protection from staphylococcal infections when vancomycin was injected subcutaneously. No protection against *Toxoplasma gondii*. [15,24,39]	Used primarily in severe staphylococcal infections: pneumonia and empyema, infections of skin and soft tissues, septicemia and endocarditis, osteomyelitis, and enterocolitis. Intravenous administration. Occasional phlebitis, chills, fever, renal irritation, urticaria, macular rashes, and hearing loss, but these side effects are less common with more highly purified preparations. Rare instances have been noted of cross-allergy with other antibiotics. [15,24,39]

/a/ Gramicidin and tyrocidine.

95. ANTICOAGULANTS

Anticoagulant dosage is usually determined in vitro from the clotting time for heparin and heparinoid compounds, or the prothrombin time for indirect anticoagulants [5,20,21,27]. In vivo, the dosage required to prevent coagulation may be many times that indicated by the test in vitro [30].

Direct Anticoagulants: Heparin and heparinoid compounds injected intravenously give a prolonged coagulation time. For some purposes, the high peak blood levels resulting from intravenous administration are essential [26]. Heparin is inactive orally [13], and intramuscular and subcutaneous injections are not as generally effective as those given intravenously [32]. The subcutaneous route, however, is the commonly accepted method of choice in doses of 75-100 mg, given each 8-12 hours (depending on the clotting time) [32]. It is desirable that the clotting time be approximately twice that of the normal control before the next dose is administered [32]. The effect on clotting time is increased and prolonged by caronamide [29] and phosphorylated hesperidin [10]. Value for maximum clotting time can be estimated from the effect of clotting time in vitro [24]. International unit of heparin = 1/130 mg of the international standard; commercial heparin = 90-120 units/mg.

Indirect Anticoagulants: These drugs usually are given orally. Dosage is dependent on the technique used to detect the change in prothrombin time and on individual susceptibility to the drug. A number of individuals in various species are refractory to one or more of these drugs, as judged by the effect on prothrombin time [25]. Significantly different results are obtained with tests for coagulation factors. The action of these drugs is cumulative and can be greatly enhanced by following the initial dose with a series of smaller doses. Such administration also avoids toxic side effects. Dicumarol must be dissolved with a small amount of 5*N* sodium hydroxide for intravenous use. It can be given intraperitoneally in suspension in propylene glycol (10-100 mg/ml). Warfarin and tromexan are more soluble than dicumarol and can be given intraperitoneally in neutral solution.

Route (column B): iv = intravenous; im = intramuscular; ip = intraperitoneal; sc = subcutaneous; rec = rectal; po = oral. Values in parentheses are ranges, estimate "b" (cf. Introduction).

	Species (Common Name)	Dose and Route	Maximum Clotting Time or Prothrombin Time		Achievement of Therapeutic Effect	Recovery Time	Remarks	Reference
			Control	Experimental				
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
	Heparin[1,2]							
1	*Homo sapiens* (man)	1,000 units (10 mg); iv	....	<4.5 min	....	....	28 hyporeactors	9
2			....	4.5-7 min	....	....	50 normal reactors	
3			....	>7 min	....	....	7 hyperreactors	

/1/ Intra-arterial injection of 1 mg heparin/100 ml of blood, plus 1.2 mg protamine/100 ml of blood into venous outflow of organ (limb, kidney), gives satisfactory local heparinization (without general heparinization) in man and dog [15]. /2/ To neutralize heparin in man and dog, slowly inject protamine in the amount of 1.2-2.5 x weight of heparin in blood, as determined by in vitro titration; excess of protamine will be anticoagulant [7,15,22].

Symptoms of Envenomation in Man	Mortality %	Available Anti-serum	Reference	
(J)	(K)	(L)	(M)	
Crotalidae[4]				
Local pain, swelling and necrosis; lymphangitis and lymphadenitis; sweating, nausea, vomiting. Severe cases: shock, petechiae, bloody stools.	<1	Yes	H,40,43,74,114;I,68; J,12,15,84	1
Similar to poisoning by *A. contortrix*, but more severe; local necrosis more marked.	2-10	Yes	H,19,23,26,40,41,43, 74,91,92,114;I,68;J, 54,84,99	2
Local pain, edema and lymphadenopathy; bleeding from fang punctures, gums, nose and other body orifices; low prothrombin, prolonged clotting time; moderate to high leukocytosis; hematuria. Severe cases: shock, failure of pupils to react to light, respiration irregular. Autopsy: hemorrhagic necrosis at site of bite; hemorrhages into muscles, bowel, central nervous system; blood incoagulable.	10-20	Yes	H,7,23,43,101,114, 116,118;I,86;J,49	3
Similar to poisoning by *B. atrox*. Autopsy: generalized visceral hemorrhages, cerebral hemorrhage, hemoglobinuric nephrosis.	5-15	Yes	H,7,23,27,42,43,67, 100,109,114,116;I, 87,88;J,68	4
Local pain, edema and ecchymoses; dryness of mouth, vomiting, shock, hemolytic anemia. Severe cases: muscular twitching, paresthesia, cyanosis, afibrogenemia, anemia, proteinuria, blood in feces, speech difficulty, sensation of yellow vision, unconsciousness.	5-15	Yes	H,21-23,40,41,43-45, 93,114,117;I,55,68; J,2,55,61,108	5
Similar to poisoning by *C. adamanteus*, but neurotic symptoms less marked. Severe cases: profound shock.	5-15	Yes	H,23,24,64,109,114, 116,117;I,55,68,84; J,25,55	6
Similar to poisoning by *Naja naja*, except that no edema occurs.	>40	Yes	H,17,23,27,36,63,101, 114,116,117;I,68,86; J,16,68	7
Usual local symptoms of *Crotalus* poisoning; also thirst, abdominal pain, vomiting, diarrhea, dyspnea. Severe cases: excitement, hypertonicity of muscles, paresthesia, convulsions, cyanosis, respiratory failure, clouding of consciousness, weakness, and sweating.	1-2	Yes	H,114;I,68;J,8,20,25, 55,81	8
Inadequate information. Rapid death preceded by severe, shocklike state.	Usually 100	Yes	H,7;I,84;J,68	9
Pain, edema, ecchymoses; weakness, sweating, vomiting. Severe cases: hemolytic anemia.	1-5	Yes	H,114,116;I,55,68,84; J,55,59	10

Symptoms of Envenomation in Man	Mortality %	Available Antiserum	Reference	
(J)	(K)	(L)	(M)	
Crotalidae[4]				
Local pain, ecchymoses, blistering; little systemic reaction.	2-10	Yes	I,57;J,95,111	11
Viperidae[5]				
Severe local edema, necrosis and sloughing; restlessness, weak pulse, dyspnea, gastrointestinal hemorrhages.	11-40	Yes	H,23,40,109,114,116; I,38;J,39,90	12
Local pain and edema; ecchymoses and hemorrhages from mucous membranes and into viscera; profound anemia, abdominal pain, impaired liver function; prothrombin time greatly prolonged, thrombocytopenia. Autopsy: intestinal and retroperitoneal hemorrhage.	11-40	Yes	D,58;H,27,33,34,36, 56,114,115;I,68;J, 69,82;L,39	13
Local pain and edema of bitten extremity, sometimes extending into trunk; hemorrhages along lymphatics. Little systemic reaction; sometimes vomiting, sweating, abdominal pain, faintness, cyanosis, shock. Ptosis common after bite by *V. berus bosniensis*.	1-5	Yes	H,109,119;I,85;J,75, 83,98,102,106	14
Rapidly spreading edema with extravasation of blood, epistaxis and petechiae, abdominal pain, vomiting, paralytic ileus, collapse, shock, albuminuria, prolonged clotting time. Terminally: loss of consciousness, failure of pupils to react to light, circulatory failure. Autopsy: subcutaneous hemorrhages near site of bite, meningeal congestion, blood in lungs.	11-40	Yes	H,19,23,33-36,40,41, 44,45,60,74,79,80, 91,114,116;I,57,77; J,13,112	15
Hydrophidae[6]				
No local reaction; latent period minutes to few hours. Giddiness, muscular aching followed by muscle weakness, ptosis, trismus, hypertension. Death from respiratory failure, cardiac arrest, or acute renal failure. Autopsy: marked, widespread myonecrosis; renal congestion with distal tubular necrosis.	12-25	Yes	D-H,10;I,9,68;J,K, 66,78	16
Elapidae[7]				
Similar to poisoning by *Notechis scutatus* except that peripheral circulatory failure is more common and hemorrhagic phenomena occur.	11-40	Yes	D,F,104;H,19,28,111, 114,116;I,71;J,53	17
Little pain or local reaction. Latent period may extend to 12 hours, followed by abdominal pain, staggering gait, dysphagia, dyspnea, ptosis, stiffness of jaws, coma, respiratory paralysis, cardiac failure.	77	Yes	H,48,74,91,114;I,48, 77;J,1,31	18
Latent period to 12 hours, followed by abdominal pain, vomiting, headache, dizziness, weakness, rapid pulse and subnormal temperature, respiratory and circulatory collapse, hemoglobinuria, and peripheral thromboses.	11-40	Yes	H,19,114,116;I,52;J, 53	19
Local pain and swelling, salivation, paralysis of vocal cords, sweating, vomiting, restlessness, drowsiness or collapse followed by coma; dyspnea and respiratory failure.	>40	Yes	H,114,116;I,14;J,76	20
Similar to poisoning by *Notechis scutatus*. Rapid loss of muscle tone and consciousness, peripheral circulatory failure.	11-40	Yes	D,F,104;H,11,19,28, 103,114,116;I,50; J,53	21
Pain; dyspnea; weak, thready pulse; cyanosis; collapse. Venom sprayed at eyes; effects resemble those produced by *Naja nigricollis*.	2-10	Yes	H,5,23,40,114,116;I, 85;J,29,90	22
Numbness without pain at bite. Early symptoms: headache, swelling of face and lips; hyperesthesia, sore throat, ptosis, photophobia, normal pupillary reflex, vomiting, cramps, dyspnea, loss of muscle tone, tachycardia. Later symptoms: backache, irritability, salivation, brachycardia, dysuria, albuminuria.	11-40	Yes	H,114-117;J,113	23
Cyclic pains radiating from site of bite; somnolence, dyspnea, dysphagia, sweating; soreness of face, throat, and eyes.	5-20	No	I,62;J,110	24
Pain radiating from site of bite; edema, numbness, tremors, ptosis, drooping of head, salivation, speech difficulty, giddiness, muscular incoordination and weakness, blindness, progressive depression of respiration, convulsions, incontinence of urine and feces. Pupils react to light, and heart continues to beat, after respiration has ceased.	11-40	Yes	H,3,6,23,30,32-34, 36,40,46,65,72-74, 79,80,94,114,117; I,77;J,1,13,31	25

characteristic activity, rather than by specific isolation, of enzyme. /3/ Dry venom administered subcutaneously. /5/ Fangs front, movable, hollow; approximately 50 species. /6/ Fangs short, front, permanently erect; approxi- 150 species.

Part III. MARINE ORGANISMS

Chordata
Gnathodentex aureolineatus (snapper); Tuamotu Archipelago west to eastern Africa
Katsuwonus pelamis (skipjack); circumtropical
Lactophrys trigonus (trunkfish); Atlantic coast of tropical America north to Cape Cod
Lactoria cornutus (trunkfish); tropical Pacific
Lethrinus miniatus (snapper-like fish); Polynesia west to eastern Africa
Lutjanus bohar (twinspot snapper); tropical Pacific to eastern Africa, Red Sea
L. gibbus (red snapper); tropical Indo-Pacific
L. monostigma (one-spot snapper); Polynesia west to Red Sea, China
L. vaigiensis (red snapper); Polynesia west to eastern Africa, Japan
Mycteroperca venenosa (sea bass); western tropical Atlantic
Pagellus erythrinus (porgy); Mediterranean & Black Seas, eastern Atlantic from British Isles & Scandinavia to Azores, Canary Islands, Fernando Po
Pagrus pagrus (porgy); E. Atlantic, Mediterranean
Paradicichthys venenatus (Chinaman fish); Australia
Parupeneus chryserydros (surmullet); Polynesia west to eastern Africa
Plectropomus oligacanthus (sea bass); Indonesia, Philippines, Caroline & Marshall Islands
Scarus caeruleus (blue parrot fish); Florida, W. Indies
S. microrhinos (parrot fish); Indo-Pacific
Sphyraena barracuda (great barracuda); Indo-Pacific, Hawaii to Red Sea, western Atlantic from Brazil to W. Indies, Florida, Bermuda
Tetragonurus cuvieri (squaretail); temperate waters
Upeneus arge (surmullet); Polynesia, Micronesia

continued

Chordata

CIGUATERA POISONING *(See* preceding page)

Symptoms: Onset within 36 hours; tingling about the lips, tongue, and throat, followed by numbness of some parts. Dryness of mouth, nausea, vomiting, and abdominal cramps common. Headache, dizziness, pallor, restlessness, weakness, blurring of vision, itching, ataxia, and convulsions may occur. Deaths reported.

Chemistry: Heat-stable; soluble in some organ solutions, but reported insoluble in water; dialyzable. [3, 6, 57, 59, 69, 79, 105, 110, 130]

3 GYMNOTHORAX POISONING, caused by ingestion of any of several species of fishes, the flesh of which becomes toxic under certain conditions.

Species & Distribution: *Gymnothorax flavimarginatus* (moray eel); Hawaiian Islands west to eastern Africa
G. javanicus (moray eel); Hawaiian Islands west to eastern Africa
G. meleagris (white-spotted moray eel); Hawaiian Islands west to eastern Africa, Japan south to Australia
G. pictus (speckled moray eel); Polynesia to eastern Africa
G. undulatus (brown moray eel); Hawaiian Islands to Red Sea & eastern Africa

Symptoms: Tingling and numbness about lips, tongue, throat, hands, and feet; feeling of heaviness in the legs. Nausea, vomiting, abdominal cramps, joint pains, difficulty in swallowing and breathing, weakness, ataxia, and convulsions may occur. Deaths reported.

Chemistry & Toxicology: Small molecular substance. Death in mice produced by 1 ml (ip). [57, 66, 104]

4 SCORPION-FISH STING, caused by contact with dorsal, pelvic, or anal spines. Venoms produced by venom glands differ in three genera: *Pterois*, *Scorpaena*, and *Synanceja*.

Species & Distribution: *Apistus carinatus* (scorpion fish); coasts of India, Indonesia, Philippines, China, Japan, Australia
Centropogon australis (waspfish); coasts of New South Wales, Queensland
Choridactylus multibarbis (stonefish); coasts of India, Philippines, Polynesia
Inimicus didactylus (lumpfish); Philippines, Malaya
I. japonicus (stonefish); coasts of Japan
Minous monodactylus (stonefish); coasts of Japan, China, S. Pacific Islands
Notesthes robusta (scorpion fish); coasts of New South Wales, Queensland
Pterois antennata (thread-finned zebra fish); tropical & temperate seas
P. lunulata (tiger fish); coasts of Japan, Banka Islands
P. volitans (turkey fish); Red Sea, Indian Ocean, Melanesia, Micronesia, Polynesia, coasts of China, Japan, Australia
Scorpaena guttata (California scorpion fish); central California coast to Gulf of California
S. plumieri (sculpin); Atlantic coast of N. America to Brazil
S. porcus (hogfish); Atlantic coast of Europe from English Channel to Canary Islands, Mediterranean & Black Seas
Scorpaenopis diabolus (scorpion fish); coasts of Indonesia, Australia, Melanesia, Polynesia
Synanceja horrida (poison stonefish); coasts of India, E. Indies, China, Philippines, Australia
S. verrucosa (poison stonefish); Red Sea, coasts of Africa, India, & Australia, tropical Indo-Pacific

Symptoms: Immediate, severe, localized pain; pallor about wound, and sometimes symptoms of primary shock. Later manifestations include severe pain and weakness of involved extremity, dyspnea, headache, nausea, and vomiting. Coma and deaths reported.

Chemistry & Toxicology: Several proteins with lethal effect in one band, as separated on gel electrophoresis. LD_{50} = 200 µg protein/kg. Produces hypotension similar to that caused by stingray and weever-fish venoms. No adrenergic-blocking action. [8, 13, 29, 56, 57, 60-62, 97, 98, 120, 124, 128, 138]

5 STINGRAY STING, caused by contact with bilaterally serrated, dentinal caudal spine or sting. Venom contained within ventrolateral grooves of sting, enveloped in an integumentary sheath.

Species & Distribution: *Aetobatus narinari* (spotted duck-billed ray); tropical & warm-temperate areas of Atlantic, Pacific, & Indo-Pacific oceans, Red Sea
Dasyatis dipterurus (diamond stingray); coast of British Columbia to Central America
D. pastinaca (stingray); northeastern Atlantic & Indian Oceans, Mediterranean & Red Seas
Gymnura marmorata (butterfly stingray); coast of California to Mexico
Myliobatis californicus (bat stingray); coast of Oregon to Lower California
Potamotrygon motoro (freshwater stingray); rivers of Paraguay, Amazon south to Rio de Janeiro
Urolophus halleri (round stingray); southern Pacific coast of N. America

Symptoms: Immediate, intense, localized pain, with increased skin temperature and discoloration or pallor about wound. Often symptoms of primary shock. Lacerated-type wound with ragged edges, some edema. Nausea, vomiting, headache, weakness, sweating, cramps, and diarrhea reported. Death extremely rare.

Chemistry & Toxicology: Several soluble protein fractions of low-to-average molecular weight, extremely labile and rapidly inactivated on heating. LD_{50} of crude extract = 15 mg/kg. Small doses produce vasodilation; large doses, vasoconstriction. Direct effect on the heart, but not on the central nervous system or neuromuscular junction. [7, 52, 58, 111-113, 115-119]

6 TETRAODON POISONING, caused by ingestion of any of a number of species of puffers, the flesh of which may become toxic under certain conditions. Toxicity thought to be related to food-chain habits. Liver, gonads, intestines, and skin most toxic.

Species & Distribution: *Arothron hispidus* (puffer); tropical Pacific to Japan & Red Sea
A. meleagris (white-spotted puffer); west coast of Central America to Indonesia
A. nigropunctatus (black-spotted puffer); Polynesia, Indo-Pacific, Japan to eastern Africa & Red Sea

continued

Chordata

Canthigaster margaritatus (sharp-nosed puffer); Red Sea, eastern Africa, Indonesia, China
C. rivulatus (sharp-nosed puffer); Japan, Hawaiian Islands
Chilomycterus spinosus (spiny boxfish); W. Indies, Brazil, S. Africa
Colomesus psittacus (freshwater puffer); rivers of Guiana, northern Brazil, W. Indies
Diodon holacanthus (balloonfish); tropical Atlantic, Pacific, & Indian Oceans
Fugu basilevskianus (puffer); northern China, northwestern Korea
F. chrysops (puffer); Pacific coast of central Japan
F. niphobles (puffer); Japan
F. ocellatus (puffer); China, Japan, Philippines
F. pardalis (puffer); China, Japan
F. pseudomus (puffer); E. China & Yellow Seas
F. rubripes (puffer); China to Korea, Sea of Japan, Pacific
F. stictonotus (puffer); southern Korea, E. China Sea, Japan
F. vermicularis (puffer); E. China Sea, Japan
F. xanthopterus (puffer); China, Korea, southern Japan
Lagocephalus laevigatus inermis (smooth puffer); eastern Africa, tropical Indian Ocean, Australia, E. China Sea, southern Japan
L. lunaris (smooth puffer); Red Sea, southern & eastern Africa, India to Australia, China, Japan
L. sceleratus (smooth puffer); east coast of Africa to Philippines, southern Japan, Australia, Tahiti
Mola mola (common ocean sunfish); temperate & tropical seas
Sphaeroides annulatus (bull's-eye puffer); Baja California to Peru, Galapagos Islands
S. maculatus (northern puffer); Atlantic coast of N. America to Guiana
S. spengleri (bandtail puffer); coasts of Texas, Florida, W. Indies, Brazil, Canary Islands, west coast of Africa
Tetraodon lineatus (puffer); rivers of Africa
Torquigener hamiltoni (puffer); Australia, Melanesia, Polynesia

Symptoms: Onset within 10-50 minutes, with tingling and numbness about mouth, lips and tongue, excessive salivation, weakness, nausea, vomiting, and difficulty in swallowing. Paresthesia and paralysis may occur over different parts of the body; convulsions and coma reported. Mortality rate about 50%.

Chemistry & Toxicology: Suggested formula, $C_{16}H_{31}NO_{16}$; soluble; LD_{50} = approximately 10 µg/kg. Direct effect on neuromuscular transmission and on nerve and muscle without depolarization. Affects heart contractile force. Causes ascending-type paralysis in laboratory animals. [10, 36, 45, 46, 57, 65, 73, 77, 90, 131, 139-142]

7 TOADFISH STING, caused by contact with opercular or dorsal spines. Venom produced in gland at base of spines.

Species & Distribution: *Batrachus cirrhosus* (toadfish); Red Sea
B. didactylus (paddefisk); Mediterranean Sea & nearby Atlantic coasts
B. grunniens (toadfish); coasts of Malaya, Burma, India, Ceylon
Opsanus tau (oyster toadfish); Atlantic coast of United States
Thalassophryne reticulata (venomous toadfish); Pacific coast of S. America

Symptoms: Onset immediate, with local pain, tenderness, increased skin temperature, and sometimes primary shock. Nausea and occasionally vomiting. Pain spreads throughout affected part; some swelling and redness about the wound. Few systemic effects; rarely serious. [9, 35, 42, 43, 49, 53, 57, 135]

8 TURTLE POISONING, caused by ingestion of any one of several species of marine turtles, the flesh of which becomes toxic under certain conditions. Rare.

Species & Distribution: *Chelonia mydas* (green sea turtle); tropical & subtropical seas
Dermochelys coriacea (leatherback sea turtle); circumtropical, occasionally found in tropical waters
Eretmochelys imbricata (hawksbill sea turtle); tropical & subtropical seas

Symptoms: Onset within 1-24 hours, with nausea, vomiting, severe abdominal cramps, increased salivation, difficulty in swallowing, and subsequent paresthesia about mouth, lips, tongue, and throat; diarrhea and tendency toward somnolence. Coma and deaths reported. [18, 57, 129]

9 WEEVER-FISH STING, caused by contact with opercular or dorsal spines or stings. Spines covered by integumentary sheath; venom-producing cells within grooves of spine.

Species & Distribution: *Trachinus araneus* (weever); Mediterranean Sea
T. draco (greater weever); Norway to N. Africa, Mediterranean & Adriatic Seas
T. radiatus (weever); Mediterranean Sea
T. vipera (lesser weever); southern North Sea, English Channel & Mediterranean Sea

Symptoms: Immediate, intense, localized pain, increasing in severity and spreading within an hour to entire extremity. Occasionally symptoms of primary shock. Increased skin temperature about wound, some edema, and localized discoloration or pallor. Puncture-type wound; necrosis reported in some cases. Weakness, headache, nausea, vomiting, and muscle fasciculations also reported.

Chemistry & Toxicology: Toxin is a "muco" substance of a combined polysaccharide-protein nature. Also contains noradrenaline, adrenaline, histamine, cholinesterase, and a trace of 5-hydroxytryptamine. Free of sulfur, lecithinase, and phosphodiesterase. Direct effect on the heart, but no effect on the central nervous system or neuromuscular junction. Little hemotoxic or anticoagulant activity. [2, 13, 14, 32, 33, 50, 54, 102, 114]

continued

96. ANIMAL TOXINS

Part III. MARINE ORGANISMS

Echinodermata

10 SEA-CUCUMBER POISONING, caused by contact.

Species & Distribution: *Euapta lappa* (sea cucumber); Bahamas
Holothuria argus (sea cucumber); Torres Strait, Pacific, Palau Islands
H. atra (sea cucumber); Guam, Palau Islands, Pacific
H. tubulosa (sea cucumber); Mediterranean
Leptosynapta ooplax (sea cucumber); Japan
Paracaudina chilensis (sea cucumber); Japan, colder seas off coasts of N. & S. America
Stichopus variegatus (curry fish); Palau Islands, Pacific
Thelenota ananas (prickly red fish); Palau Islands, Japan

Symptoms: Localized pain, inflammation, tenderness

Chemistry & Toxicology: Holothurin A ($C_{50-52}H_{81-85}O_{5-6}SNa$), a steroid saponin, is comparable as a blocking agent to procaine and physostigmine on desheathed sciatic nerve of frogs, except that the action is irreversible. Produces irreversible block of direct and indirect twitch response, along with contracture, in mammalian nerve-muscle preparation. [15, 17, 23, 40, 41, 91-93, 96, 121]

11 SEA-URCHIN STING, caused by contact with spines or globiferous pedicellariae of any of several species of sea urchins.

Species & Distribution: *Asthenosoma ijimai* (sea urchin); southern Japan to Molucca Sea
Diadema setosum (reef urchin); Indo-Pacific from eastern Africa to Polynesia, China, Japan. Related species in W. Indies, Hawaiian Islands.
Toxopneustes elegans (sea urchin); Japan
T. pileolus (sea urchin); Indo-Pacific from eastern Africa to Melanesia, Japan

Symptoms: Immediate, localized pain; some redness about wound and aching in injured part. In more severe cases, primary shock, muscular paralysis, and respiratory distress may occur. Death rare.

Chemistry & Toxicology: Heat-stable; curare-like activity. [13, 21, 22, 28, 44, 89, 100, 127, 132]

Annelida

12 WORM BITE, caused by bite or stinging setae.

Species & Distribution: *Eurythoe complanata* (bristle worm); Gulf of Mexico, tropical Pacific
Glycera dibranchiata (bloodworm); Canadian coast to N. Carolina
Lumbriconereis heteropoda (marine worm); Japan

Symptoms: Pain similar to that caused by beesting; some localized edema, increased skin temperature, redness, and itching.

Chemistry & Toxicology: A tertiary amine; suggested formula, $C_5H_{11}NS_2$. Stimulates parasympathetic activity. Direct effect on the heart and nervous system. [57, 68, 75, 94, 95]

Mollusca

13 CONE STING, caused by contact with venom apparatus consisting of a bulb, duct, radular sheath, and radular teeth.

Species & Distribution: *Conus aulicus* (court cone); Polynesia to Indian Ocean
C. geographus (geography cone); Indo-Pacific from eastern Africa to Polynesia
C. striatus (striated cone); Indo-Pacific from eastern Africa to Australia
C. textile (textile cone); Polynesia to Red Sea
C. tulipa (tulip cone); Polynesia to Red Sea

Symptoms: Immediate, localized pain; ischemia, and sometimes numbness about puncture wound. Tingling or paresthesia about injured part; may spread. Muscular incoordination, paresis or paralysis, and visual disturbances reported. Deaths reported within 3-5 hours.

Chemistry & Toxicology: Toxin contains a protein, quaternary ammonium compounds, and possibly amines. Produces hyperexcitability, ataxia, dyspnea, respiratory distress in mice; paralysis in fishes and mammals. [1, 19, 24, 25, 30, 37, 72, 76, 126, 137]

14 OCTOPUS BITE. Venom apparatus consists of anterior and posterior salivary glands, salivary ducts, buccal mass, and mandibles or beak.

Species & Distribution: *Octopus apollyon* (octopus); Pacific coast of N. America
O. macropus (octopus); Europe, Mediterranean and Red Seas, Indian Ocean, Malaysia, coasts of China, Japan, Australia
O. vulgaris (octopus); warm seas

Symptoms: Burning or tingling about wound punctures. Pain spreads to involve entire extremity. Wound bleeds freely. Some increased skin temperature; local redness and edema reported.

Chemistry & Toxicology: Composed of octopamine, serotonin, serotonin decomposition product, histamine, dopamine, and other substances. Anticoagulant and cardiotoxic activity; no cholinesterase or aminoxidase activity. [4, 5, 11, 47, 55, 57, 67, 82]

15 PARALYTIC SHELLFISH POISONING, caused by ingestion of mollusks which have fed upon toxic dinoflagellates.

Species & Distribution: *Cardium edule* (cockle); European seas
Donax serra (white mussel); South Africa
Ensis directus (razor clam); New England coast to Florida
Modiolus modiolus (horse mussel); Pacific coast of N. America from Arctic to Baja California; circumboreal.

continued

Part III. MARINE ORGANISMS

Mollusca

Mya arenaria (soft shell clam); coasts of Britain, Scandinavia, Greenland, Japan, Atlantic & Pacific coasts of N. America
Mytilus californianus (ocean mussel); eastern Alaska south to Socorro Island
M. edulis (mussel); Arctic to S. Carolina, Alaska to Baja California; found in most temperate waters
Saxidomus giganteus (butter clam); Alaska to central California
S. nuttalli (butter clam); northern California to Baja California
Schizothaerus nuttalli (gaper clam); Alaska to Baja California; northern coast of Japan
Spisula solidissima (surf clam); Labrador to N. Carolina

Symptoms: *See* entry 21.

Chemistry & Toxicology: *See* entry 21. [16, 31, 39, 48, 51, 57, 83, 85-87, 90, 122, 123, 125]

Cnidaria

16 HYDROID STING, caused by contact with nematocysts.

Species & Distribution: *Millepora alcicornis* (stinging coral); tropical Pacific, Indian Ocean, Caribbean & Red Seas

Symptoms: Burning sensation, itching, localized redness, occasional pustules and desquamation.

Chemistry & Toxicology: *See* entry 18. [15, 71, 103, 134, 136]

17 JELLYFISH STING, caused by contact with nematocysts located for the most part on the tentacles.

Species & Distribution: *Carybdea alta* (sea wasp); tropical Pacific, Atlantic, & Indian Oceans
Chiropsalmus quadrigatus (sea wasp); northern Australia, Philippines, Indian Ocean
Cyanea capillata (giant jellyfish); N. Atlantic & N. Pacific Oceans, New England to Arctic Ocean, France to northern Russia, Baltic Sea; Alaska to Puget Sound, Japan and China
Dactylometra quinquecirrha (pink-fringed jellyfish); Azores & New England to the tropics, W. Africa. Indian Ocean, western Pacific Ocean, Malaya to Japan & Philippines

Symptoms: Burning sensation with itching, localized edema and redness.

Chemistry & Toxicology: (*See also* entry 18.) Medusocongestin present in some animals. Slow-reacting, histamine-liberating substance. Toxin hypersensitizes temperature perception organ. [34, 38, 57, 70, 74, 81, 101, 133]

18 PHYSALIA STING, caused by contact with nematocysts.

Species & Distribution: *Physalia physalis* (Portuguese man-o'-war); tropical Atlantic. Related species in Indo-Pacific, Hawaii, southern Japan.

Symptoms: Burning, localized pain; itching, edema, redness; erythematous wheals and paresthesia in some cases. Gastrointestinal symptoms, muscular weakness, and contractures in more severe cases. Respiratory distress and secondary shock may develop. Fatal cases reported.

Chemistry & Toxicology: Toxin contains several quaternary ammonium compounds, the most toxic being tetramine. Serotonin and histamine present; also histamine releasers and possibly several peptides; LD_{99} = approximately 2.2 mg/kg. [38, 71, 78, 80, 84, 100, 101, 103]

19 SEA-ANEMONE STING, caused by contact with nematocysts.

Species & Distribution: *Actinia equina* (sea anemone); E. Atlantic from Arctic to Gulf of Guinea, Mediterranean & Black Seas, Sea of Azov
Adamsia palliata (cloak anemone); Norway to Spain; Mediterranean Sea
Anemonia sulcata (sea anemone); E. Atlantic from Norway & Scotland to the Canary Islands; Mediterranean Sea
Sagartia elegans (sea anemone); Iceland to Atlantic coast of France, Mediterranean Sea, coast of Africa

Symptoms: Stinging sensation on contact; may be followed by itching, localized edema, and redness. Papules develop in severe cases. Death very rare. "Sponge fisherman's disease" attributed to *Sagartia*.

Chemistry & Toxicology: Toxin composed of several substances, including congestin and thalassin. Congestin is water-soluble, heat-resistant, and produces vomiting, diarrhea, and visceral congestion. Thalassin is a water-soluble, alcohol-precipitated crystal, antagonistic to congestin. Scratching and sneezing in dogs caused by 100 µg. Tetramine also present. [15, 23, 74, 99, 100, 109, 136, 143]

Porifera

20 SPONGE STING, caused by contact.

Species & Distribution: *Fibulia nolitangere* (brown sponge); W. Indies
Tedania ignis (fire sponge); W. Indies
T. toxicalis (fire sponge); California coast

Symptoms: Burning sensation, itching, urticaria, and occasionally localized edema.

Toxicology: Intraperitoneal injections of crude extracts lethal to mice [27, 63]. Kills aquarium animals [26].

Protozoa

21 PARALYTIC SHELLFISH POISONING, caused by ingestion of mollusks which have fed on toxic dinoflagellates. (*See also* entry 15.)

Species & Distribution: *Gonyaulax catenella* (dinoflagellate); Pacific coast of United States
G. polygramma (dinoflagellate); Japan, S. Africa
G. tamarensis (dinoflagellate); Atlantic coast of N. America
Gymnodinium brevis (dinoflagellate); Florida coast
Pyrodinium phoneus (dinoflagellate); North Sea

continued

Part III. MARINE ORGANISMS

Protozoa
PARALYTIC SHELLFISH POISONING *(See* preceding page) **Symptoms**: Onset within 10 minutes to 4 hours, with weakness, thirst, and numbness about lips, mouth, tongue, and fingertips; followed by muscular incoordination, progressive paralysis (ascending type), and respiratory failure. Death may occur within 2-24 hours. **Chemistry & Toxicology**: Basic substance forms salt with mineral acids. Optical rotation of 130°, with no absorption in ultraviolet. Formula, $C_{10}H_{17}N_7O_4 \cdot 2HCl$; molecular weight, 372. Direct effect on heart and myoneural junction. One of most potent toxins known, approximately 3 mg fatal to humans. [51, 83, 86, 88, 90, 122, 123, 125]

97. PLANT TOXINS

	Plant (Common Name); Toxic Portion; Distribution	Toxic Principle	Signs and Symptoms Produced	Remarks
	(A)	(B)	(C)	(D)
1	*Abrus precatorius* (rosary pea); seeds, possibly root; southern Florida & tropics	Abrin (*N*-methyl-tryptophane) and abric acid [49]	Onset may be delayed several hours to two days; vomiting, diarrhea, acute gastroenteritis, chills, sometimes convulsions [34]. Severe cases: death from heart failure [49].	Two ounces of seed fatal to horse; one seed chewed may be fatal to child [49]. Boiled seeds may be eaten, but in quantity cause headache [10].
2	*Aconitum napellus* (aconite monkshood); roots, leaves, flowers, seeds; northeastern United States, Canada, Europe, Asia [23]	Principally aconitine, aconine, napelline; eight other alkaloids reported [51]	Tingling, burning sensation in tongue, throat, skin; great restlessness, dyspnea, slow pulse, muscular weakness, incoordination, cold and livid skin, pupillary constriction, followed by dilation [44]; vomiting, diarrhea, convulsions, possibly death in 1-8 hours by respiratory or cardiac paralysis [17].	Young leaves mistakenly eaten for parsley, and the roots for horseradish. Considered most dangerous of all British plants [17].
3	*Agrostemma githago* (corn cockle); seeds; United States, Canada, Europe [34]	Githagin, agrostemmic acid (saponins) [34,49]	Man: vertigo, diarrhea, depressed breathing [34]; irritation of digestive tract, vomiting, headache, sharp pains in spine, difficult locomotion, sometimes coma and death [8]. Horses, cattle: colic, diarrhea, muscular tremors, rigidity, coma, death [9].	Milled seeds sometimes in wheat flour [17]; frequent ingestion of small amounts results in chronic githagism [34]; 0.25-1 lb/100 lb live wt fatal to stock [34].
4	*Amanita phalloides* (death cup); entire fungus; N. America, Europe, E. Indies, Australia	Phalloidin [17]; *Amanita* hemolysin possibly a factor in poisoning when mushroom is eaten raw [16]	After 6-15 hours, abdominal pain [17]; vomiting, diarrhea, intense thirst, recurrent drowsiness [23,28]; respiratory and circulatory depression, delirium, and sometimes convulsions [40]; jaundice, hepatitis and renal disturbances, coma, death from heart failure.	One of the most deadly fungi, mortality about 50%; cause of majority of "mushroom deaths" in U.S. [17,40,44]. Genus contains other equally poisonous, and some edible, species [21].
5	*Antiaris toxicaria* (upas tree); milky sap; southern Asia, E. Indies [40]	Antiarin (α-, β-) [7]	Skin irritation, blistering, swelling [37]; vomiting, convulsions, death [7].	One of the principal arrow poisons; more potent than digitalis [7,40]. Cloth made from bark causes severe itching if sap not completely removed [7].
6	*Astragalus* spp. (locoweed); fresh plant; northern hemisphere [34]	Selenium; locoine in some species [34]	Horses, cattle: dullness, weakness, irregularity in behavior, impaired vision, edema of eyelids, loss of muscular control, depraved appetite, emaciation, starvation, death. Sheep: same symptoms as above and possibly blindness [34].	Hazard to livestock industry in U.S.; toxicity varies with locality [8]; some species harmless.

continued

	Plant (Common Name); Toxic Portion; Distribution	Toxic Principle	Signs and Symptoms Produced	Remarks
	(A)	(B)	(C)	(D)
7	*Atropa belladonna* (belladonna); entire plant, especially seeds, roots, leaves; eastern United States, Europe, Asia [34]	Chiefly hyoscyamine; atropine and hyoscine in small amounts [17]; six other alkaloids reported [51]	Man, acute: dryness of skin, mouth, throat [10]; difficulty in swallowing, flushing of face, cyanosis, mydriasis, nausea, vomiting, constipation, slurred speech, giddiness, stupor, coma, rapid and weak pulse, fever, death from asphyxia and heart failure [23]. Chronic: erythema, urticaria, vesicular eruptions, slurred speech, mydriasis, glaucoma, muscular tremors or twitchings; sudden withdrawal causes nausea, salivation, perspiration [6]. Cattle: mydriasis, constipation, rapid pulse, labored breathing, frenzy, paralysis [23].	Cultivated as source of the drug belladonna [35]. Children and grazing animals often poisoned by eating fruit of plant. Flesh of rabbits which have fed on plant is toxic to humans [17].
8	*Cannabis sativa* (hemp); upper leaves, flower bracts of female plants; United States, Mexico, tropical America, Europe, temperate Asia [34]	Cannabinol and cannabidiol, the latter isomerized to highly active tetrahydrocannabinol [47]	Man: exaltation, inebriety, confusion, followed by central nervous system depression. Prolonged addiction may produce dullness or mania [20,45]; large quantities may result in death from cardiac depression [10].	Dried leaves and bracts smoked by drug addicts; seeds harmless [34,49]. Used in "bird seed"; yields hemp seed oil for paints, etc.; plant stem yields hemp fiber for cordage, carpets, etc.
9	*Cicuta* spp. (water hemlock; primarily roots; leaves, stems less toxic; northern temperate regions [17,34]	Cicutoxin [34]	Man, other animals: abdominal pain, nausea, vomiting, diarrhea, mydriasis, labored breathing, foaming at mouth, weak and rapid pulse, epileptoid convulsions, death from respiratory failure [17,34].	Genus includes the most poisonous plants in U.S. Fatalities have resulted from mistaking roots for parsnips [17,34].
10	*Claviceps purpurea* (ergot claviceps); sclerotium; N. America, Europe, Asia, Australia [35]	Ergotoxine, ergotamine, ergonovine, ergometrine [18]	Man, acute: vomiting, diarrhea, respiratory difficulties, visual and motor disturbances followed by convulsions, lowered blood pressure, shallow respiration, unconsciousness. In pregnancy, possibly uterine hemorrhage, abortion, peripheral gangrene. Chronic, convulsive type: vomiting, itching, paresthesia, analgesia of extremities, anorexia or uncontrollable hunger, diarrhea, muscle contracture, delirium, sometimes a tabes-like complex. Gangrenous type: pustules may form, limbs swell and become hot, and gangrene may follow. [44] Cattle: gastrointestinal irritation, gangrene of extremities, uterine contractions, nervous disturbances [45].	Occurs on rye, wheat, oats, barley, and other grasses; cause of many cases of poisoning (ergotism) in man and livestock [4,45]. Ergot preparations valued medicinally, chiefly for effect on muscles of uterus [17]; ergometrine causes abortion [18].
11	*Colchicum autumnale* (autumn crocus); entire plant, principally mature corms [38], seeds [32]; United States, Europe, N. Africa [17]	Colchicine [34]	Man: burning in throat; 6-8 hours later a feeling of suffocation, oppression in chest, difficulty in swallowing, vomiting, diarrhea, colic, tenesmus, giddiness, weakness in legs, arthralgia, cyanosis, labored breathing, convulsions [31,45]. Death from respiratory exhaustion in 7-36 hours; consciousness preserved to end. Other animals: nausea, vomiting, colic, diarrhea, hematuria, depression, unconsciousness, paralysis, mydriasis, profuse perspiration, death in 1-3 days [45].	Widely grown in flower gardens. Colchicine arrests mitosis [32]; employed in treatment of gout [43]; also used in plant breeding.
12	*Conium maculatum* (poison hemlock); fruit, especially unripe; stems, leaves, roots; N. America, temperate S. America, Europe, N. Africa, Asia [17,34]	Coniine, conhydrine, *N*-methylconiine, coniceine [9,34]; 3 other alkaloids reported [51]	Man: mydriasis [17]; paralysis of extremities, muscular weakness, often blindness, death from respiratory paralysis [23,34]. Cattle: mydriasis [17]; inappetence, salivation, bloating, muscular weakness [34]; coma [23]. Horses: mydriasis [17]; nausea, grinding of teeth, rapid and labored respiration, paralysis, death from respiratory failure [23].	Leaves most toxic when plant is flowering; root less toxic in spring [34]. Resemblance of fruit to anise, leaves to parsley, and root to parsnips responsible for many human fatalities [17]. Plant commonly fatal to livestock [8].

continued

	Plant (Common Name); Toxic Portion; Distribution	Toxic Principle	Signs and Symptoms Produced	Remarks
	(A)	(B)	(C)	(D)
13	*Croton tiglium* (purging croton); roots, leaves, bark, seeds; southern Asia, E. Indies, Pacific Islands, Africa [40]	Crotin, croton resin [37]; ricinine [51]	Vomiting, drastic purging, possibly collapse and death [40]. Croton oil is a skin irritant, causing reddening, swelling, pustules [7].	Croton oil formerly a human and veterinary purgative; abandoned as too violent. Now used to lubricate machinery. Smoke from burning wood inflames eyes [7].
14	*Datura stramonium* (jimsonweed datura), *D. metel* (Hindu datura), and other species; entire plant, especially seeds; temperate, tropical and subtropical regions	Hyoscine, also hyoscyamine (optically active forms), and the racemic mixture, atropine [3]	Man: headache, nausea, vertigo, thirst, dry and burning sensation in skin, loss of muscular control, mydriasis. Acute poisoning results in mania, convulsions, death [34]; nonfatal poisoning usually causes loss of memory, mental confusion [40,45]. Cattle: mydriasis, suspension of secretions or diarrhea, rapid heart action, paralysis, death from asphyxia. Swine: convulsive twitching [23].	Daturas widely grown for ornament. Children poisoned by eating seeds or sucking flower. In Asia and Africa, adults poisoned by ingesting seeds for intoxicating effect. Accidental mixing of seed with grain, or gathering of young plants with other greens, also responsible for poisoning. [50] Products used medicinally, also criminally, for narcotic effect [45].
15	*Delphinium* spp. (larkspur); seeds, leaves; to a lesser degree, roots; north temperate regions, especially western United States	Delphinine, delphinoidine, delphisine, staphisagroine [34]; 30 other alkaloids reported [51]	Man: burning and inflammation of mouth and pharynx, lowered blood pressure, nausea, abdominal pain, labored respiration, itching, cyanosis. Other animals: uneasiness, stiffness, staggering, constipation, frothing at mouth, nausea, bloating [34]; spasms, respiratory failure [49].	Second to *Astragalus* in causing fatalities among livestock in U.S. [34]; leaves and seeds may cause dermatitis. Horticultural varieties common in flower gardens. Seeds long used in insecticide [49].
16	*Digitalis purpurea* (common foxglove), and *D. lanata* (Grecian foxglove); entire plant, especially seeds, leaves; western Europe, western United States, other areas [23]	*D. purpurea*: diacetyldigilanid A and B; *D. lanata*: digilanid A, B, and C	Anorexia, nausea, vomiting, slow and pronounced pulse in early stages [34]; cardiac arrhythmias, diarrhea, abdominal pain, headache, fatigue, malaise, drowsiness, convulsions, rapid irregular pulse, death in severe cases [19].	Common in flower gardens [34]. Dry plants in hay have poisoned horses and cattle; fresh leaves fatal to turkeys [17]. Digitalis and derivatives used in cardiovascular therapy [37].
17	*Dioscorea hispida* (wild yam); entire plant, tubers; southern Asia, E. Indies, Pacific Islands [7]	Dioscorine [40,50]	Discomfort, then burning, in throat; giddiness, vomiting of blood, suffocation, drowsiness, exhaustion [7]; paralysis of nervous system [40,50].	Raw tubers a frequent cause of death in Philippines [40]. Edible after grating, boiling, repeated washing and soaking [7].
18	*Erythroxylon coca* (Huanuco cocaine tree); leaves; northern S. America, tropics of both hemispheres [40]	Cocaine; 13 other alkaloids reported [51]	Acute: general central nervous system stimulation, followed by depression, numbness of tongue, paralysis of respiratory centers, cyanosis, shallow and irregular breathing, often sudden death from asphyxia [44].	Leaves commonly chewed as a stimulant by Indians of Peru and Bolivia. Cocaine used as a local anesthetic; misused by drug addicts.
19	*Euphorbia* spp. (euphorbia); milky sap; worldwide [34]	A complex substance, euphorbiosteroid [17]; euphorbon, euphorboresene, and an acrid substance reported [7, 9,34,52]; also cyanogenetic glucosides in some species [18]	Man: dermatitis, eye irritation, temporary blindness [23]; swelling around mouth and eyes, burning in mouth and throat, sneezing, vomiting, diarrhea, hemorrhagic gastroenteritis [49]; fainting, death [7,34]. Other animals: blistering of skin, loss of hair, weakness, collapse, death [34].	Various species grown for ornament. Euphorbium derived from *E. resinifera* (gum euphorbia), formerly used medicinally, now in paint as protectant [7]; *Euphorbia* sap mixed with arrow poison as cohesive irritant [49].
20	*Helleborus niger* (black Christmas rose); rootstock, leaves; Europe, United States [34]	Helleborin, helleborein, hellebrin [17, 34,37]	Man: severe dermatitis in some individuals [34]; violent inflammation of mucous membranes of stomach and intestines [36]; vomiting, dizziness, convulsions, sometimes death; effect on heart similar to digitalis [37].	Cultivated in flower gardens; rootstock formerly source of an official drug [37].

continued

	Plant (Common Name); Toxic Portion; Distribution	Toxic Principle	Signs and Symptoms Produced	Remarks
	(A)	(B)	(C)	(D)
21	*Hippomane mancinella* (manchineel); milky sap, fruit; Florida, Central America, northern S. America, W. Indies [27]	Physostigmine or similar alkaloid, plus a sapogenin [27]	Man: severe burning of skin, swelling and possibly hemorrhage in eyes; temporary blindness from sap. [1,27] Fruit causes gastroenteritis which may be fatal; ulceration of intestinal tract proceeds slowly [27,34].	Apparently more toxic in summer than in winter [27]. Sap used as arrow poison; smoke from burning wood toxic [1].
22	*Hyoscyamus niger* (black henbane); entire plant, especially leaves; northwestern United States, Canada [34], Mediterranean region, Asia, Oceania	Hyoscyamine, hyoscine, atropine, and other alkaloids [22, 34,36]	*See Atropa belladonna*	Usually avoided by animals because of unpleasant taste. Children poisoned by eating seeds and pods [34]. Roots mistaken for parsnips [17]. Leaves and flowering tops used in medicine [35].
23	*Jatropha curcas* (Barbados nut); seeds, milky sap; tropics [49], southern Florida	Curcin [50]	Man: burning in throat, bloating, dizziness, vomiting, diarrhea, drowsiness, possibly dysuria and mydriasis [45]; severe leg cramps, deafness [24]; violent purgative action often fatal to children [1]. Other animals: hemorrhagic enteritis, staggering, dull vision, mydriasis, bloating, paralysis, somnolence, convulsions, fever, shivering, coma, death in 1-3 days in acute cases [45].	Sap used as fish poison [7]; seeds yield "hell oil," formerly given as purgative, now used for soap in Cape Verde Islands and Ecuador. Seeds of *J. multifida*, a tropical ornamental, often cause poisoning in children.
24	*Kalmia latifolia* (mountain laurel), and *K. angustifolia* (lambkill kalmia); all parts except wood; northeastern United States, Canada, Pacific coast [8]	Andromedotoxin [34]	Man: similar to symptoms produced in other animals, plus pain in head, sweating, tingling of skin [10]. Other animals (usually sheep): salivation, flow of tears, secretions from nose, frothing at mouth, impaired vision or blindness, dizziness, irregular respiration, vomiting, convulsions, paralysis of limbs, coma, death [8,34].	Children have been poisoned by eating leaves mistaken for wintergreen [8]. Frequent cause of fatal poisoning of livestock, especially sheep.
25	*Lathyrus sativus* (grass peavine); seeds, mature plant; southern United States, southern Europe, N. Africa, Asia [34,45]	β-Aminopropionitrile [47]	Man: pain in back [49]; sudden weakness in legs; further ingestion may cause leg paralysis. Other animals: similar to symptoms produced in man, plus asphyxia. Cattle also develop constipation, weak pulse, numbness of skin [45]; general weakening of tendons and ligaments, tissue fragility; connective tissue malformations, such as exostoses, hernias, and aneurysms [47].	*L. sativus*, *L. cicera*, and *L. clymenum* used as food and fodder [49], but cause many cases of lathyrism in man and livestock [45]. *L. odoratus*, the sweet pea of flower gardens, has fatally poisoned children.
26	*Leucaena glauca* (white popinac lead tree); leaves (especially immature), bark, roots; southern United States, tropics [40,46]	Mimosine (leucenol) [46]	Horses, mules, donkeys: alopecia of manes and tails, possibly deformation or loss of hoofs [23,50]; in severe cases, lameness, debility, death from hunger and thirst [18]. Swine: total alopecia, impaired vision, emaciation, various degrees of paralysis, respiratory failure [23,50].	A fodder plant for cattle, sheep, goats (immune to toxicity) [23]. Ripe seeds used as coffee substitute [39]. Young leaves and unripe seeds, cooked as vegetables, occasionally cause loss of hair in humans [30].
27	*Lupinus* spp. (lupine); seeds most toxic, pods less, leaves least; temperate regions [45]	Lupanine and 30 other alkaloids reported [51]	Liver damage due to poisoning by ingestion. European lupinosis, chronic: anemia, cachexia. Acute: fever, general jaundice, coma, paralysis, constipation, then hemorrhagic diarrhea, swelling of ears, eyelids, lips, nose. American lupinosis: frothing at mouth, dyspnea, frenzied actions, nausea, bloating, coma, possibly death [17,18, 45].	Toxicity varies with season and location; some species harmless [34]. Many livestock deaths, especially of sheep, from ingestion of lupine seeds in quantity [18].

continued

	Plant (Common Name); Toxic Portion; Distribution	Toxic Principle	Signs and Symptoms Produced	Remarks
	(A)	(B)	(C)	(D)
28	*Manihot esculenta* (cassava); roots (especially skin and juice), mature leaves, stems, fruit; tropics [7,40]	Cyanogenetic glucosides [42]	Man, livestock: nausea [50]; rapid and labored breathing; rapid, irregular, weak pulse; twitching, staggering, spasms of neck and legs, convulsions, mydriasis, coma, death from respiratory paralysis [45].	Bitter cultivars, high in CN^-, yield starch for tapioca; sweet cultivars, with little or no CN^-, widely cooked as starchy vegetables [42].
29	*Melia azedarach* (chinaberry); fruit pulp, bark, flowers; southern United States, tropical America, S. Africa, southwestern Asia [45]	Azadarin (margosine) affects central nervous system [34, 45,49]	Man, leaf poisoning: stomatitis, decrease in urine formation, violent and bloody vomiting [45]. Fruit poisoning: nausea, vomiting, labored breathing, palpitation, paralysis [34]. Other animals (especially swine): vomiting, colic, diarrhea, labored breathing, cyanosis, convulsions or paralysis, death by asphyxia [49].	Common shade tree. Roots, bark, leaves, flowers, fruit used for stupefying fish [1]; various parts of tree used in folk medicine [49]; seeds yield medicinal oil [49].
30	*Metopium toxiferum* (poisonwood); entire plant, especially sap; southern Florida, W. Indies [11], Bahamas	Probably similar to poison ivy	Dermatitis similar to that caused by poison ivy [11,34]. Blistering may continue for weeks, readily spreading from one area to another; may be accompanied by intense itching, burning. Severe cases require hospitalization.	Smoke from burning wood highly irritating [12]. Clear, sticky sap turns black on exposure to air.
31	*Nerium oleander* (oleander); leaves, bark, roots, flowers; southern United States, tropics, subtropics [40]	Principally neriin, oleandrin, and folinerin, resembling digitalis in action; rosagenin (in bark) similar to strychnine [49]	Man: vomiting, slow and irregular pulse, bloody diarrhea, death from cardiac or respiratory paralysis. Other animals: similar to symptoms produced in man, plus sweating, gnashing of teeth, groaning, sometimes polyuria [45].	Popular ornamental shrub. Often poisons grazing animals; 15-20 g fresh plant fatal to horse. Smoke from burning plant toxic; meat roasted on skewers of oleander wood, or food stirred with oleander sticks, fatally toxic [1,23,45].
32	*Papaver somniferum* (opium poppy); milky exudate from incised unripe seed pod, which is dried as "opium" [34]; southern Europe, Asia, tropics, subtropics	Morphine (chiefly); also codeine, thebaine, papaverine, and narcotine [45]	Acute: central nervous system depression, symmetrical pinpoint pupils, depressed respiration, cyanosis, coma, death from depression of respiration and circulation. Chronic: varies with individual case [48].	Cultivated in flower gardens as well as for commercial drug production. Animals infrequently poisoned by eating seed pods [34]. Seeds harmless, commonly used in bakery products.
33	*Phytolacca americana* (pokeberry); roots, seeds, mature (red) stems; eastern & southern United States [34], Europe, S. Africa [49]	Phytolaccine [51]	Burning and bitterness in mouth, vomiting, purging, spasms, sometimes convulsions, death from respiratory paralysis [34].	Young shoots edible if well-cooked [34]; fruit juice harmless, used as food coloring [49]. Root has been accidentally gathered with shoots, or mistaken for parsnips or horseradish [34,49].
34	*Prunus* spp. (chokecherry, other wild cherries); leaves (especially wilted), bark, seeds; northern hemisphere, Orient [34]	Hydrocyanic acid formed by action of enzymes upon amygdalin (?) or prunasin [34]	Animals: uneasiness, staggering, falling, convulsions, labored breathing, bloating, death [34].	Frequent cause of fatal poisoning of livestock [34].
35	*Rhus toxicodendron* (poison ivy), and *R. vernix* (poison sumac); entire plant; N. America [34]	Urushiol [14]	Man: skin irritation, swelling, blisters, extreme discomfort, itching; sometimes fatal to children [34].	Smoke from burning plant toxic; estimated 1,000,000 Americans get ivy poisoning each year [14].
36	*Ricinus communis* (castor bean); seeds; southern United States, tropics, subtropics [34]	Ricin (a toxalbumin), and the less toxic alkaloid, ricinine [18]; also a castor bean allergen [41]	Man: burning in mouth, throat, stomach; vomiting; diarrhea; thirst; rapid, then faint pulse; cramps of abdomen, legs; convulsions; shallow respiration. Other animals: hemorrhagic enteritis,	Some varieties cultivated as ornamentals; 2-3 seeds may be fatal to child, 6 may kill horse [49]. Seeds yield castor

continued

	Plant (Common Name); Toxic Portion; Distribution	Toxic Principle	Signs and Symptoms Produced	Remarks
	(A)	(B)	(C)	(D)
	Ricinus communis (*See* preceding page)		staggering, dulled vision, heart weakness, bloating, paralysis, convulsions, fever, shivering, coma, death in 1-3 days [45].	oil; processors subject to conjunctivitis, dermatitis, and respiratory allergy; efforts being made to detoxify protein-rich presscake for feed [41].
37	*Senecio* spp. (groundsel); entire plant, especially seeds; worldwide	Of numerous toxic alkaloids isolated, senecifolidine, isatidine, pterophine, retrorsine, scleratine, and senecionine are responsible for "bread poisoning" and liver cirrhosis [49].	Man: abdominal pain, vomiting, ascites, enlarged liver, emaciation, bloody diarrhea. Generally fatal if not treated early; when not immediately fatal, liver damage may bring about subsequent death [45]. Grazing animals: yawning, inappetence, emaciation, staggering, colic [34]; unconsciousness, death from liver cirrhosis [49].	Seeds of various species in harvested grain considered responsible for "bread poisoning" [13]; senecio poisoning common in livestock [34].
38	*Strophanthus* spp. (strophanthus); seeds, roots, bark; southern Florida, tropical America, tropical Africa [40]	An alkaloid, trigonelline [51], and 64 cardiac glucosides and aglycons reported [49]	Vomiting, slow and irregular pulse, blurred vision, delirium, death from circulatory failure of cardiac origin [13,44].	Arrow poisons from several species [40]. *S. sarmentosus* is source of sarmentogenin, which is chemically converted to cortisone [33,49].
39	*Strychnos nuxvomica* (nuxvomica poison nut); seeds, leaves, bark, wood, flowers; India, Hawaii [2,23,40]	Strychnine, brucine [40]; six other alkaloids reported [51]	Action on spinal cord causes excessive reflex irritability, followed by rapid tonic convulsions with intermissions of exhaustion and sweating; extreme muscular rigidity, asphyxia, death. Mind not affected [40].	Strychnine formerly used as stimulant; tonic in minute amounts [40]. Children poisoned by pills. Poisoned grain used as gopher bait.
40	*S. toxifera* (curare poison nut); bark, roots; Central America, northern S. America [1]	Principally toxiferines I-XII [29], caracurines I-IX; 12 other alkaloids reported [51]	Haziness of vision, relaxation of facial muscles, inability to raise head, loss of muscular contraction in arms and legs, depressant effects on muscles of respiration, muscle nerve end-plate paralysis [15].	Often main ingredient in certain kinds of curare famed as Indian blowgun poison [15,29]. Tubocurarine chloride (U.S.P.) now used as skeletal muscle relaxant in shock therapy and as diagnostic aid [25].
41	*Thevetia peruviana* (thevetia); seeds, leaves, bark, roots, milky sap; tropics [7,40]	Thevetin, thevetoxin, neriifolin [49]	Man: vomiting, diarrhea, high blood pressure, erratic heart beat, death from asphyxiation and sudden heart paralysis [2,40]. Contact with sap may inflame and blister skin [1].	Seeds used as fish poison, and for suicide and homicide.
42	*Veratrum viride* (American false hellebore); entire plant; United States, Canada [8, 26]	Protoveratrine A and B, germerine, jervine; 15 other alkaloids reported [51]	Man: vomiting, abdominal pain, muscular weakness, spasms, possibly convulsions, rapid pulse, shallow breathing, semiconsciousness, death from asphyxia [34].	This and related species yield veratrum, a therapeutic agent for hypertension [26].
43	*Zigadenus* spp. (death camas); leaves, stems, flowers, bulb; northern hemisphere, especially United States [34,38]	Zygadenine, similar to veratrine and cevadine in action [34]	Animals: salivation, vomiting, lowered temperature, staggering or collapse, labored breathing, paralysis, possibly coma and death [5,34].	Frequent cause of fatal poisoning of livestock. Children occasionally poisoned by eating bulb [34].

X. BIOPHYSICAL AND BIOCHEMICAL CHARACTERISTICS

98. CARBOHYDRATES: PHYSICAL AND CHEMICAL CHARACTERISTICS

All data are for crystalline substances, unless otherwise specified. In Parts I-V, the selection of substances was restricted to natural carbohydrates found free (or in chemical combination and released on hydrolysis) and to biological oxidation products of the natural carbohydrates. In Part VI, the selection of oligosaccharides was restricted to those substances found free. The nomenclature conforms with that of the British-American report as published in the *Journal of Organic Chemistry*, 28:281 (1963). Substances have been arranged alphabetically under the name of the parent sugar within groups formulated according to increasing carbon content (excluding carbon in substituents), with synonymous common names in parentheses. **Melting Point:** b.p. = boiling point; d. = decomposes; s. = sinters. **Specific Rotation** was determined in water at concentrations of 1-5 g per 100 ml of solution and at 20°-25°C, unless otherwise specified; other temperatures or wavelengths are shown in brackets; *c* = grams solute per 100 ml of solution. The literature has been covered by means of *Chemical Abstracts* through 1962.

Part I. NATURAL MONOSACCHARIDES: ALDOSES AND KETOSES

	Substance (Synonym)	Chemical Formula	Melting Point °C	Specific Rotation $[\alpha]_D$	Reference
	(A)	(B)	(C)	(D)	(E)
	Aldoses				
1	D-Glyceraldehyde	$C_3H_6O_3$	....	+13.5±0.5 (syrup)	122
2	D-Glyceraldehyde, 3-deoxy-3,3-*C*-bis(hydroxymethyl)- (Cordycepose)	$C_5H_{10}O_4$	....	-26 (*c* 0.6, C_2H_5OH)	9,10
3	D-Glyceraldehyde, 3,3-bis(*C*-hydroxymethyl)- (Apiose)	$C_5H_{10}O_5$	....	+5.6 (*c* 10) [15°] (syrup)	101,114
4	β-D-Arabinose	$C_5H_{10}O_5$	155	-175 → -103	38,46,97, 99
5	D-Arabinose, 2-*O*-methyl-	$C_6H_{12}O_5$	Syrup	-102	38,73
6	α-L-Arabinose	$C_5H_{10}O_5$	158 amorphous	+55.4 → +105	112
7	β-L-Arabinose	$C_5H_{10}O_5$	160	+190.6 → +104.5	81
8	DL-Arabinose	$C_5H_{10}O_5$	163.5-164.5	None	98,121
9	α-L-Lyxose	$C_5H_{10}O_5$	105	+5.8 → +13.5	1
10	L-Lyxose, 5-deoxy-3-*C*-formyl- (Streptose)	$C_6H_{10}O_5$	....	....	61
11	L-Lyxose, 3-*C*-formyl- (Hydroxystreptose)	$C_6H_{10}O_6$	....	....	108
12	Pentose, 4,5-anhydro-5-deoxy-D-*erythro*-	$C_5H_8O_3$	....	....	47
13	Pentose, 2-deoxy-D-*erythro*-	$C_5H_{10}O_4$	96-98	-91 → -58	24
14	D-Ribose	$C_5H_{10}O_5$	87	-23.1 → -23.7	87
15	D-Ribose, 2-*C*-hydroxymethyl- (Hamamelose)	$C_6H_{12}O_6$	....	-7.1 [λ 578]	33
16	α-D-Xylose	$C_5H_{10}O_5$	145	+93.6 → +18.8	50,52
17	D-Xylose, 5-deoxy-	$C_5H_{10}O_4$	....	+16	36
18	β-D-Xylose, 2-*O*-methyl-	$C_6H_{12}O_5$	137-138	-21 → +34	64,65,73
19	α-D-Xylose, 3-*O*-methyl-	$C_6H_{12}O_5$	95	+45 → +19	5,64,65
20	D-Allose, 6-deoxy-	$C_6H_{12}O_5$	140-143 146-148	+1.6 [18°] (*c* 0.6) -4.7 → 0	57 25
21	D-Allose, 6-deoxy-2,3-di-*O*-methyl- (Mycinose)	$C_8H_{16}O_5$	102-106	-46 → -29	25
22	Amicetose (a trideoxy hexose)	$C_6H_{12}O_3$	Oil, b.p. 65-70	+28.6 ($CHCl_3$)	106
23	Antiarose	$C_6H_{12}O_5$	....	Levo	60
24	α-D-Galactose	$C_6H_{12}O_6$	167	+150.7 → +80.2	96
25	β-D-Galactose	$C_6H_{12}O_6$	143-145	+52.8 → +80.2	96,124
26	D-Galactose, 3,6-anhydro-	$C_6H_{10}O_5$	....	+21.3 [10°]	4,85
27	α-D-Galactose, 6-deoxy- (D-Fucose; Rhodeose)	$C_6H_{12}O_5$	140-145	+127 → +76.3 (*c* 10)	116
28	D-Galactose, 6-deoxy-3-*O*-methyl- (Digitalose)	$C_7H_{14}O_5$	106[1], 119[2]	+106	66
29	D-Galactose, 6-deoxy-4-*O*-methyl-	$C_7H_{14}O_5$	131-132	+82	34
30	D-Galactose, 6-deoxy-2,3-di-*O*-methyl-	$C_8H_{16}O_5$	....	+73	58,102
31	α-D-Galactose, 3-*O*-methyl-	$C_7H_{14}O_6$	144-147	+150.6 → +108.6	89
32	α-D-Galactose, 6-*O*-methyl-	$C_7H_{14}O_6$	122-123	+117 → +77.3	40,83
33	L-Galactose	$C_6H_{12}O_6$	....	*See* D-Galactose	
34	α-L-Galactose, 3,6-anhydro-	$C_6H_{10}O_5$	....	-39.4 → -25.2	3
35	α-L-Galactose, 6-deoxy- (L-Fucose)	$C_6H_{12}O_5$	145	-124.1 → -76.4	77

98. CARBOHYDRATES: PHYSICAL AND CHEMICAL CHARACTERISTICS

Part III. NATURAL ALDITOLS AND INOSITOLS (with Inososes and Inosamines)

	Substance (Synonym)	Chemical Formula	Melting Point °C	Specific Rotation $[\alpha]_D$	Reference
	(A)	(B)	(C)	(D)	(E)
	Inositols				
23	*d*-Bornesitol (a *myo*-inositol monomethyl ether)	$C_7H_{14}O_6$	200	+31.6	20,22
24	*l*-Bornesitol (a *myo*-inositol monomethyl ether)	$C_7H_{14}O_6$	205-206	-32.1	11
25	Conduritol (a 2,3-dehydro-2,3-dideoxyinositol)	$C_6H_{10}O_4$	142-143	None (meso)	30
26	Cordycepic acid (a tetrahydroxycyclohexanecarboxylic acid)[2]	$C_7H_{12}O_6$	....	....	15
27	Dambonitol (a *myo*-inositol dimethyl ether)	$C_8H_{16}O_6$	206	None (meso)	17
28	DL-Inositol	$C_6H_{12}O_6$	253	None (racemic)	53
29	*d*-Inositol	$C_6H_{12}O_6$	....	+60	8
30	*l*-Inositol	$C_6H_{12}O_6$	240	-65	51
31	Laminitol (a *C*-methyl *myo*-inositol)	$C_7H_{14}O_6$	266-269	-3	32
32	Liriodendritol (a *myo*-inositol dimethyl ether)	$C_8H_{16}O_6$	224	-25	40
33	*muco*-Inositol monomethyl ether	$C_7H_{14}O_6$	322-325	....	3
34	*myo*-Inositol (*meso*-Inositol)	$C_6H_{12}O_6$	217-218	None (meso)	35
35	*d*-*myo*-Inosose-1 (a deoxy keto inositol)	$C_6H_{10}O_6$	138-139	+19.6	34
36	Mytilitol (a *C*-methyl *scyllo*-inositol)	$C_7H_{14}O_6$	259	None (meso)	1
37	*neo*-Inosamine-2 (a deoxy amino inositol)	$C_6H_{13}O_5N$	239-241 d.	None (meso)	4
38	*d*-Ononitol (a *myo*-inositol monomethyl ether)	$C_7H_{14}O_6$	172	+6.6	41
39	*d*-Pinitol (a *dextro*-inositol monomethyl ether)	$C_7H_{14}O_6$	186	+65.5	37
40	*l*-Pinitol (a *levo*-inositol monomethyl ether)	$C_7H_{14}O_6$	186	-65	5,42
41	*l*-Quebrachitol (a *levo*-inositol monomethyl ether)	$C_7H_{14}O_6$	190-191	-80.2 [28°]	2,16
42	*d*-Quercitol (a deoxy *dextro*-inositol)	$C_6H_{12}O_5$	235	+24.2	45
43	*d*-Quinic acid (a trideoxy carboxy *dextro*-inositol)	$C_7H_{12}O_6$	164	+44 (*c* 10)	55
44	*l*-Quinic acid (a trideoxy carboxy *levo*-inositol)	$C_7H_{12}O_6$	162	-42.1	23
45	Quinic acid, 5-dehydro-	$C_7H_{10}O_6$	140-142 (138 s.)	-82.4 [28°]	58
46	Scyllitol (*scyllo*-Inositol; Cocositol)	$C_6H_{12}O_6$	352-353	None (meso)	38,44
47	Sequoyitol (a *myo*-inositol monomethyl ether)	$C_7H_{14}O_6$	234-235	None (meso)	50
48	Shikimic acid (a 3,4-anhydro-quinic acid)	$C_7H_{10}O_5$	183-184	-200 [16°]	19
49	Shikimic acid, 5-dehydro-	$C_7H_8O_5$	150-152	-57.5 [28°] (EtOH)	49
50	Streptamine (2,4-diaminodideoxyscyllitol)	$C_6H_{14}O_4N_2$	88, 210-250 d.	None (meso)	27
51	Streptamine, 2-deoxy-	$C_6H_{14}O_3N_2$	....	None (meso)	18,31
52	Streptadine (1,3-Dideoxy-1,3-diguanidino-scyllitol)	$C_8H_{18}N_6O_4$	....	None (meso)	39
53	Viburnitol (a deoxy *levo*-inositol)[3]	$C_6H_{12}O_5$	174	-73.9	26

/2/ Strong evidence that cordycepic acid is really D-mannitol [52]. /3/ Not an enantiomorph of *d*-quercitol; other isomeric relationship is involved.

Part IV. NATURAL ALDONIC, URONIC, AND ALDARIC ACIDS

A number of "keto" acids, reported in the literature as stemming from biological systems, have not been included since they are still grossly undefined [4,27].

	Substance (Synonym)	Chemical Formula	Melting Point °C	Specific Rotation $[\alpha]_D$	Reference
	(A)	(B)	(C)	(D)	(E)
	Aldonic Acids				
1	D-Glyceric acid	$C_3H_6O_4$	Gum	Dextro	15
2	L-Glyceric acid	$C_3H_6O_4$	Gum	Levo	15
3	D-Arabinonic acid	$C_5H_{10}O_6$	114-116	+10.5 (*c* 6)	35
4	L-Arabinonic acid	$C_5H_{10}O_6$	118-119	-9.6 → -41.7[1]	32
5	L-Arabinonic-1, 4-lactone	$C_5H_8O_5$	97-99	-72	5
6	D-Ribonic acid	$C_5H_{10}O_6$	112-113	-17.0	22
7	D-Xylonic acid	$C_5H_{10}O_6$	....	-2.9 → +20.1[1]	33
8	L-Xylonic acid	$C_5H_{10}O_6$	....	-91.8[1]	20
9	D-Altronic acid	$C_6H_{12}O_7$	....	+11.5 → +24.8[1] (Ca salt, *N* HCl)	19,34
10	D-Galactonic acid	$C_6H_{12}O_7$	122	-11.2 → +57.6[1]	21,30
11	D-Gluconic acid	$C_6H_{12}O_7$	130-132 (110-112 s.)	-6.7 → +11.9[1]	31
12	L-Gulonic acid	$C_6H_{12}O_7$	Exists only in soln.	[ca. 0°]	8
13	Hexsonic acid, 2-deoxy-D-*arabino*-	$C_6H_{12}O_6$	93-95	+68 (lactone)	14,40
14	2-Hexulosonic acid, D-*arabino*-	$C_6H_{10}O_7$	....	-81.7 (Na salt)	26
15	2-Hexulosonic acid, 3-deoxy-D-*erythro*-	$C_6H_{10}O_6$	....	-29.2 (*c* 6, Ca salt)	25
16	2-Hexulosonic acid, D-*lyxo*-	$C_6H_{10}O_7$	169	-5	12
17	5-Hexulosonic acid, D-*arabino*-	$C_6H_{10}O_7$	108-109	....	3
18	5-Hexulosonic acid, D-*xylo*-	$C_6H_{10}O_7$	....	-14.5	7
19	D-Mannonic acid	$C_6H_{12}O_7$	....	-15.6	23
20	D-Gluconic acid, *O*-β-D-galactopyranosyl-(1 → 4)- (Lactobionic acid)	$C_{12}H_{22}O_{12}$	....	+25.1 (Ca salt)	37
	Uronic Acids				
21	L-Lyxuronic acid	$C_5H_8O_6$	....	....	1,2

/1/ Equilibrates with the lactone.

Part VI. NATURAL OLIGOSACCHARIDES

Substances have been arranged in groups (disaccharides, trisaccharides, etc.) according to increasing carbon atom content in the parent component monosaccharide units. Within groups, substances are arranged alphabetically according to the name of the initial glycosyl monosaccharide unit in the oligosaccharide. **Substance** (column A): Gal = galactose; Man = mannose; Xyl = xylose; G = glucose; Fru = fructose; Fuc = fucose; *p* = pyranose; *f* = furanose.

	Substance (Synonym)	Chemical Formula	Melting Point °C	Specific Rotation $[\alpha]_D$	Reference
	(A)	(B)	(C)	(D)	(E)
1	*O*-α-D-Gal*p*-(1 → 1)-D-glycerol	$C_9H_{18}O_8$	150-152	+155	111
2	*O*-β-D-Gal*p*-(1 → 1)-D-glycerol	$C_9H_{18}O_8$	139-140	+3.8	13
3	*O*-α-D-Gal*p*-(1 → 2)-glycerol (Floridoside)	$C_9H_{18}O_8$	86-87, 128	+151, +165	14, 70, 84
4	*O*-β-D-Gal*p*-(1 → 1)-L-glycerol	$C_9H_{18}O_8$	131.5-133	+159	111
5	*O*-α-D-Man*p*-(1 → ?)-L-glyceric acid	$C_9H_{16}O_9$	88-89	+105 [15°]	15

103. PHOSPHATIDES AND CEREBROSIDES: PHYSICAL AND CHEMICAL CHARACTERISTICS

Data are for synthetic lipids containing known fatty acids. Naturally occurring lipids contain a spectrum of fatty acids [11-13, 16-23, 26] and have different properties dependent on their fatty-acid composition. **Solubility** (column F): ac.a. = acetic acid; acet. = acetone; bz. = benzene; c.tet. = carbon tetrachloride; chl. = chloroform; die. = diethyl; e.acet. = ethyl acetate; e.al. = ethanol; eth. = ether; ethy. = ethylene; glac. = glacial; gly. = glycol; i. = insoluble; me.al. = methanol; monome. = monomethyl; pet. = petroleum; pyr. = pyridine; sl. = slightly; s. = soluble; v. = very; w. = water.

16	7β-Hydroxycholesterol (Δ^{5}-Cholestene-3β,7β-diol)	$C_{27}H_{46}O_2$	178	+7.2	Liver (cattle, swine); spleen (swine); serum (pregnant mare)	19,37,55,63
17	22-Hydroxycholesterol (Δ^{5}-Cholestane-3β,20α-diol)	$C_{27}H_{46}O_2$	186	-39	Lily	75,84
18	(Cholestan-3β-ol-6-one)	$C_{27}H_{46}O_2$	143	....	Spleen (swine)	63
19	(Cholestane-3β,5α-diol-6-one)	$C_{27}H_{46}O_3$	236	....	Cholesterol; liver (swine)	71
20	Cholestanol[4] (Cholestan-3β-ol)	$C_{27}H_{48}O$	142	+24	Cholesterol; sclerotic aorta	54,69,70
21	Coprostanol (Coprostan-3β-ol)	$C_{27}H_{48}O$	101	+28	Feces	56
22	Epicoprostanol (Coprostan-3α-ol)	$C_{27}H_{48}O$	117	+32	Feces; ambergris	56
23	(Cholestane-3β,5,6β-triol)	$C_{27}H_{48}O_3$	239	+3.2	Liver (cattle); testis (swine); sclerotic aorta	35,38,68
24	Dehydroergosterol ($\Delta^{5,7,9(11),22}$-Ergostatetraen-3β-ol)	$C_{28}H_{42}O$	146	+149	Yeast; ergot	67,93
25	14-Dehydroergosterol ($\Delta^{5,7,14,22}$-Ergostatetraen-3β-ol)	$C_{28}H_{42}O$	198	-396	Mold	8
26	24-Dehydroergosterol ($\Delta^{5,7,22,24(28)}$-Ergostatetraen-3β-ol)	$C_{28}H_{42}O$	118	-78	Yeast	23
27	Fungisterol (Δ^{7}-Ergosten-3β-ol)	$C_{28}H_{44}O$	148	-0.2	Ergot	88
28	Ergosterol ($\Delta^{5,7,22}$-Ergostatrien-3β-ol)	$C_{28}H_{44}O$	165	-130	Ergot; yeast; *Aspergillus niger*	20,29,39,57, 77,78
29	22-Dihydroergosterol ($\Delta^{5,7}$-Ergostadien-3β-ol)	$C_{28}H_{46}O$	153	-109	Ergot	66
30	Brassicasterol ($\Delta^{5,22}$-Ergostadien-3β-ol)	$C_{28}H_{46}O$	148	-64	Rapeseed; invertebrates	16
31	24-Methylenecholesterol[5] ($\Delta^{5,24(28)}$-Ergostadien-3β-ol)	$C_{28}H_{46}O$	144	-42	Sponge; mollusks; honeybee	10,17,27,43, 44
32	5-Dihydroergosterol ($\Delta^{7,22}$-Ergostadien-3β-ol)	$C_{28}H_{46}O$	174	-20	Yeast	6,7,24
33	($\Delta^{7,24(28)}$-Ergostadien-3β-ol)	$C_{28}H_{46}O$	131	+6.0	Starfish	29
34	Episterol ($\Delta^{7,24(28?)}$-Ergostadien-3β-ol)	$C_{28}H_{46}O$	151	-5	Yeast	6,7,89,91
35	Ascosterol ($\Delta^{8,23(?)}$-Ergostadien-3β-ol)	$C_{28}H_{46}O$	147	+45	Yeast	90-92
36	Fecosterol ($\Delta^{8,24(28)}$-Ergostadien-3β-ol)	$C_{28}H_{46}O$	162	+42	Yeast	90,92
37	Cerevisterol ($\Delta^{7,22}$-Ergostadiene-3β,5α,6β-triol)	$C_{28}H_{46}O_3$	265	-79	Yeast; ergot	41,88
38	Haliclonasterol	$C_{28}H_{48}O$	141	-41.5	Sponge; green algae	11
39	Campesterol (Δ^{5}-24-Isoergosten-3β-ol)	$C_{28}H_{48}O$	158	-33	Rapeseed; soybean; wheat germ	30

/1/ The numbers after the symbol "Δ" indicate the position of double bonds in the basic cyclopentano perhydrophenanthrene ring. /2/ Methyl sterols not included. /3/ Chloroform solvent for most determinations. /4/ Also isolated from invertebrates. /5/ Earlier preparations containing this substance referred to as chalinasterol and ostreasterol.

3	Vitamin A, neo-		2-*cis*-Vitamin A	$C_{20}H_{30}O$	Yellow needles	59-60
4	Vitamin A aldehyde	Retinene; retinal; axerophthal	All-*trans* form	$C_{20}H_{28}O$	Orange crystals	61-64
5	*p*-Aminobenzoic acid	PABA		$C_7H_7NO_2$	Monoclinic prisms from dilute alcohol	187.0-187.5
6	Ascorbic acid	Vitamin C; antiscorbutic factor	L-*threo*-2,3,4,5-6-Pentahydroxy-2-hexeno-γ-lactone	$C_6H_8O_6$	Crystals, plates or needles; monoclinic, colorless	190-192 (some decomposition)
7	Biotin	Vitamin H; coenzyme R; factor S, W, X; bios II G; antiegg-white injury factor	*cis*-Hexahydro-2-oxo-1H-thieno [3,4] imidazole-4-valeric acid	$C_{10}H_{16}N_2O_3S$	Fine long needles or white crystalline powder	232-233 (some decomposition)
8	Choline		(β-Hydroxyethyl)-trimethylammonium hydroxide	$C_5H_{15}NO_2$	Colorless, viscous, hygroscopic alkaline liquid	
9	Cobalamin	Cyanocobalamin (vitamin B_{12}); hydroxycobalamin (vitamin B_{12a}, B_{12b})	5,6-Dimethylbenzimidazolyl cyanocobamide	$C_{63}H_{90}CoN_{14}O_{14}P$	Hygroscopic, dark red needles; birefringent	Darkens at 210-220; not melted at 300
10	Vitamin D_2	Calciferol; ergocalciferol; activated ergosterol; antirachitic factor; oleovitamin D_2; viosterol	9,10-Secoergosta-5,7,10(19),22-tetraen-3-ol	$C_{28}H_{44}O$	Prisms from acetone	115-118; sublimes in very high vacuum without decomposition
11	Vitamin D_3	Activated 7-dehydrocholesterol; cholecalciferol; oleovitamin D_3	22,23-Dihydro-24-demethylcalciferol	$C_{27}H_{44}O$	Fine needles from dilute acetone	84-85
12	Vitamin E	α-Tocopherol, antisterility factor	5,7,8-Trimethyltocol	$C_{29}H_{50}O_2$	Slightly viscous, pale yellow oil	Boils at 200-220 at 0.1 mm
13		β-Tocopherol[5]	5,8-Dimethyltocol	$C_{28}H_{48}O_2$	Yellow oil	
14		γ-Tocopherol[5]	7,8-Dimethyltocol	$C_{28}H_{48}O_2$	Crystals	
15		σ-Tocopherol[5]	8-Methyltocol	$C_{27}H_{46}O_2$	Yellow oil	
16	Inositol	*meso*-Inositol; *i*-inositol; bios I	Hexahydroxycyclohexane	$C_6H_{12}O_6$	Efflorescent crystals (dihydrate)	218, dihydrate; 225-227, anhydrous
17	Vitamin K_1	Antihemorrhagic vitamin	2-Methyl-3-phytyl-1,4-naphthoquinone	$C_{31}H_{46}O_2$	Yellow, viscous oil	-20; decomposes above 100-120
18	Vitamin K_2		2-Methyl-3-difarnesyl-1,4-naphthoquinone	$C_{41}H_{56}O_2$	Yellow crystals	53.5-54.5
19	Nicotinic acid	Niacin; P.P. factor	Pyridine-3-carboxylic acid	$C_6H_5NO_2$	Colorless needles	236.5

/1/ Measurement based on sodium light of wavelength 589 mμ, unless otherwise indicated. /3/ $E^{1\%}_{1\,cm}$ = extinc- α-tocopherol.

PHYSICAL AND CHEMICAL CHARACTERISTICS

XI. ENVIRONMENT AND SURVIVAL

112. HIBERNATION: MAMMALS AND BIRDS

Hibernation in homiotherms is a lethargic condition characterized by a lowering of the temperature of the body to approximately the temperature of the environment--with a concurrent reduction in metabolism--and the resumption of the elevated temperature at some future time without the aid of heat from external sources.

	Species (Common Name)	Distribution	Temperature °C Air	Temperature °C Rectal	Heart Rate beats/min	Respiration Rate breaths/min	O_2 Consumption ml/g body wt/hr	CO_2 Production ml/g body wt/hr	RQ[1]	Reference

113. DIAPAUSE: INSECTS AND MITES

Diapause in insects and mites may be facultative (influenced by the environment and not present in each generation) or obligate (occurring in virtually every individual and in each generation without respect to environment). Species experiencing facultative diapause generally complete two or more generations annually (bivoltine or multivoltine cycles), whereas those with obligate diapause produce one generation (univoltine cycle). **Dormant Stage** (column B): I = instar; FI = final instar; FD = fully developed; S = small; HG = half-grown.

	Species (Common Name)	Dormant Stage	Diapause		Reference
			Type	Duration	
	(A)	(B)	(C)	(D)	(E)
	Insecta				
1	*Aedes hexodontus* (mosquito)	Embryo (FD)	Obligate	Throughout winter	5
2	*A. tristeriatus* (mosquito)	Embryo (FD)	Facultative	Up to 6 months	3
3	*Anax imperator* (darner)	Larva (FI)	Facultative	2-3 months	13
4	*Anthrenus verbasci* (varied carpet beetle)	Larva (S-FI)	Obligate	Many months	7
5	*Apanteles glomeratus* (little braconid)	Prepupa	Facultative	....	19
6	*Bombyx mori* (silkworm)	Embryo (S or HG)	Facultative[1] or obligate[2]	5-9 months	22
7	*Cephus cinctus* (wheat stem sawfly)	Prepupa	Obligate	6-8 months	31
8	*Ceratophyllus fasciatus* (European rat flea)	Larva (FI)	Obligate	2-12 months	2
9	*Drosophila deflexa* (fruit fly)	Larva (FI)	Facultative	Several months	4
10	*Dytiscus marginalis* (diving beetle)	Adult	Obligate[3]	....	21
11	*Ephestia elutella* (tobacco moth)	Larva	Facultative	8-9 months	34
12	*Epilachna corrupta* (ladybird beetle)	Adult	Facultative	Throughout winter	17
13	*Eurydema ornatum* (ornate vegetable bug)	Adult	Facultative	....	10
14	*Eurygaster integriceps* (soun pest)	Adult	Obligate	....	18
15	*Leptinotarsa decemlineata* (Colorado potato beetle)	Adult	Facultative[3]	Many months	11,12
16	*Lestes sponsa* (damselfly)	Egg	Obligate	15 weeks	14
17	*Locusta migratoria gallica* (migratory locust)	Egg	Obligate	14-156 days	23
18	*Malacosoma disstria* (forest tent caterpillar)	Embryo (FD)	Obligate	6-9 months	20
19	*Melanoplus bivittatus* (two-striped grasshopper)	Embryo (FD)	Obligate	Few weeks to many months	32
20	*M. differentialis* (differential grasshopper)	Egg	Obligate	Few weeks to many months	8,9
21	*Melittobia chalybii* (chalcid)	Larva (FI)	Facultative	Several months	33
22	*Phaenicia sericata* (greenbottle fly)	Larva (FI)	Facultative	Several weeks to many months	15,29
23	*Pieris rapae* (imported cabbageworm)	Pupa	Facultative	6-52 weeks	28
24	*Popillia japonica* (Japanese beetle)	Larva (3rd I)	Facultative	50 days	25,26
25	*Pyrausta nubilalis* (European corn borer)	Larva (FI)	Facultative[1] or obligate[2]	6-9 months	1
26	*Reduvius personatus* (masked hunter)	Larva	Obligate	Few weeks to several months	30
27	*Samia cynthia* (cynthia moth)	Pupa	Facultative	....	16
28	*Trichogramma cacaeciae* (fairyfly)	Larva (FI)	Facultative	6-8 months	27
	Acari				
29	*Metatetranychus ulmi* (European red mite)	Egg	Facultative	....	6,24
30	*Tetranychus telarius* (two-spotted spider mite)	Adult	Facultative	....	24

114. DISPERSION OF SMALL ORGANISMS

Units Dispersed (columns C-G): Values are means.

Part I. INVERTEBRATES

Dispersion by flight may possibly be aided by air movements.

	Invertebrate (Common Name) [Means of Dispersion]	Distances and Units Dispersed						Reference
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
	Horizontal Dispersion							
1	*Aedes* spp. (mosquito) [flight]	Miles from original case Yellow fever cases	17.5 14.6	32.5 4.6	47.5 1.7	62.5 0.8	92.5 0.6	91
2	*A. aegypti* (yellow-fever mosquito) [flight]	Meters from release point Eggs in traps	250 1,100	750 46	1,250 40	1,750 5	2,250 2	98
3	*A. albopictus* (mosquito) [flight]	Yards from release point Mosquitoes recovered	25 92	125 43	225 2	325 1	475 2	5
4	*A. communis* (mosquito) [flight]	Feet from release point (subarctic) Mosquitoes recovered	75 80	300 24	1,000 6	2,000 1	5,000 1	43
5	*A. leucocelaenus & Haemagogus spegazzinii* (forest mosquitoes) [flight]	Kilometers from release point Mosquitoes recovered/100 man-hr	1.0 7	2.0 1	2.4 0.5	2.7 0.2	4.0 0.1	12
6	*A. polynesiensis* (mosquito) [flight]	Yards from release point Mosquitoes recovered	0 37	50 8	100 3	150 0		41
7	*Agriotes obscurus* (click beetle) [walking, running]	Feet from release point Beetles/trap	3 12	9 3	18 0.6	36 0.1		79
8	*Anastatus bifasciatus* (gypsy moth egg parasite) [flight]	Yards from release point Eggs parasitized, % (north) Eggs parasitized, % (south)	100 23 32	900 12 20	1,500 9 18	3,900 4 13	5,100 3 12	16
9	*Anopheles funestrus* (mosquito) [flight]	Yards from riverbank Mosquitoes caught	100 179	600 14	1,200 5	2,400 4		20
10	*A. gambiae* (African malaria mosquito) [flight]	Miles from release point Mosquitoes recovered	0.75 3.0	1.25 2.2	1.75 1.6	2.25 1.2		20
11	*A. pseudopunctipennis* (mosquito) [flight]	Miles from release point Mosquitoes recovered	0-1 16	1-2 10	2-3 8	3-4 6		77
12	*A. quadrimaculatus* (malaria mosquito) [flight]	Feet from source Mosquitoes caught	500 71	1,500 43	2,500 30	3,500 22	6,500 6	81
13		Feet from mosquito source Malarial infections, %	500 36	1,500 22	3,500 11	6,000 4		81
14		Miles from breeding-site reservoir Females caught/wk	0.5 542	1.5 79	2.5 5	3.5 3	4.5 1	27
15	*Anthonomus grandis* (boll weevil) [flight]	Yards from overwinter area Weevils trapped	220 59	440 43	880 26	1,320 17	1,760 9	32
16	*A. grandis* [crawling]	Feet from release point Females recovered Males recovered	25 17 28	75 8 6	125 3 2	175 0 1	225 0 0	75
17	*Apis mellifera* (honeybee) [flight]	Yards from apiary Honeybees found	5.5 6.1	11 3.9	16.5 2.6	22 1.6	33 0.3	26

		Larvae found	56	34	13	7	0	
93	*Rhabdocnemis obscura* (New Guinea sugarcane weevil) [flight, crawling]	Feet from release point	265	405	600	740	825	88
		Weevils recovered	26	16	8	4	1	
		Days to recovery	52	60	70	76	78	
94	*Rhagoletis pomonella* (apple maggot) [flight]	Feet from release point	37.5	87.5	137.5	187.5	237.5	66
		Maggots recovered	47	33	26	21	17	
95	*Saissetia oleae* (black scale) [air currents]	Feet from source	13	35	100	250	450	73
		Scales caught	564	433	293	172	92	
96	*Scolytus multistriatus* (smaller European elm bark beetle) [flight]	Feet from source	50	100	200	400	1,000	89
		Twig crotches wounded, %	39	23	14	8	3	
97	*Simulium* sp. (blackfly) [flight]	Miles from release point	0.5	2.5	4.5	9.5	10.5	17
		Flies recovered/visit	2.3	0.4	0.1	0.1	0	
98		Days between release and recovery	5	25	45	65		17
		Flies caught	30	0	1	2		
99	*Sitophilus oryza* (rice weevil) [probably crawling]	Feet from source	50	100	200			24
		Weevils found	3	2	1			
100	*Tiphia vernalis* (Japanese beetle parasite) [flight]	Feet from feeding area	7	21	49	77	90	34
		Eggs/larva	3.7	3.2	2.7	2.5	2.4	
101	*Trioza tripunctata* (blackberry psyllid) [crawling]	Rows from field margin	1	3	5	10	20	64
		Psyllids/10 bushes	10	5	4	3	1	
102	*Tyloderma fragariae* (strawberry crown borer) [crawling]	Yards from release point	25	50	68	125	300	76
		Borers recovered	6	6	5	4	1	
		Vertical Dispersion						
103	*Anopheles* spp. (mosquito) [flight]	Altitude, meters (in forest)	0	5	10	15		19
	A. darlingi	Distribution, %	51	18	19	12		
	A. mediopunctatus	Distribution, %	3	3	39	55		
	A. shannoni	Distribution, %	4	7.3	24.6	64.1

114. DISPERSION OF SMALL ORGANISMS

Part I. INVERTEBRATES

	Invertebrate (Common Name) [Means of Dispersion]	Distances and Units Dispersed						Reference
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
	Vertical Dispersion							
104	*Anopheles quadrimaculatus* (malaria mosquito) [flight]	Altitude, feet	1.5	3.0	6.0	7.5		28
		Mosquitoes caught	14	11	5	3		
105	Aphididae (aphid) [flight]	Altitude, feet	50	250	500	1,000	1,500	44
		Aphids caught	270	228	75	21	6	
106	Aphididae [air currents, flight]	Altitude, miles	0.17	1.15	2.17	2.68		68
		Aphids caught	2	9	16	19		
107	Aphididae, 7-hr collection [flight]	Altitude, feet	10	150	500	1,000		45
		Aphids caught/hr	18	3	2	1		
108	*Circulifer tenellus* (beet leafhopper) [flight]	Altitude, feet	8	16	25			21
		Leafhoppers caught	276	211	169			
109		Altitude, feet	2.5	15	32			52
		Parasitism, %	3.5	1.7	0.9			
110	Coccinellidae (ladybird beetle) [flight]	Altitude, miles	0.17	1.15	2.17	2.68		68
		Beetles caught	40	13	4	1		
111	*Drosophila* sp. (fruit fly) [flight]	Altitude, miles	0.54	2.04	3.54	5.04		68
		Flies caught	413	237	164	117		
112	*Epitrix hirtipennis* (tobacco flea beetle) [flight]	Altitude, feet	12	19	23			1
		Beetles caught	96	41	18			
113		Altitude, feet	1.5	5	14	19	23	22
		Beetles caught/day	56	32	12	6	2	
114	*Heterodera rostochiensis* (golden nematode of potato) [wind currents]	Height of trap, inches	22	38	55			92
		Viable cysts	2,077	435	103			
115	Insects, miscellaneous [flight, air currents]	Altitude, feet	10	177	277			29
		Insects caught/cu ft air	239	51	21			
116		Altitude, feet	20	1,000	4,000	7,000		35
		Insects caught/10 min flight	26	6	3	1		
117	*Psallus seriatus* (cotton fleahopper) [flight, air currents]	Altitude, feet	5.5	11.5	17.5	23.5		22
		Fleahoppers caught	61	97	156	250		
118	*Pyrausta nubilalis* (European corn borer) [flight]	Altitude, feet	5	10	15			33
		Moths caught	914	547	332

115. EFFECT OF TEMPERATURE ON INACTIVATION AND SURVIVAL: VIRUSES

Part I. ANIMAL VIRUSES

	Virus	Substrate	Inactivation Temp. °C	Inactivation Time min	Reference
	(A)	(B)	(C)	(D)	(E)
1	Adenovirus		56	2.5-5.0	17
2			56	30	10
3	Common cold		56	30	2,3
4	Coxsackie A		53-55	30	4
5	Coxsackie C	Aqueous suspension	60	30	17
6		Milk, cream	70-80	30	17
7		Tissue suspension[1]	55	30	5
8		Water	60	30	13
9	Dengue		50	30	21
10	Distemper, canine		58	20	20
11			60	30	15
12	Encephalitis, western equine	Filtrate	56	30	8
13			60	10	17
14	Foot-and-mouth disease	Defibrinated blood	55	20	16
15		Epithelium suspension[2]	85	360	6
16		Vesicular fluid	60	5	16
17	Fowl plague		55	30	15
18	Herpes simplex	Aqueous suspension	52	30	12
19		Moist	52	30	3
20		Dry	90	30	3
21	Hog cholera		60-70	60	19
22	Infectious hepatitis		56	30	17
23			60	60	
24	Influenza A	Allantoic preparation	55	5-15	9
25			56	30[3]	3
26			67	30	1
27	Influenza B	Allantoic preparation	56	15-30	9
28	Louping ill		56	30	7
29		Tissue suspension[1]	58	10	17
30			60	2	17
31			80	0.5	17
32	Lymphogranuloma venereum		56	10	17
33	Measles		55	15	19
34			56	60	12
35	Mumps		55	20	17
36			56	20	3

/1/ Mouse brain. /2/ Cattle tongue. /3/ Some strains 90 minutes.

115. EFFECT OF TEMPERATURE ON INACTIVATION AND SURVIVAL: VIRUSES

Part I. ANIMAL VIRUSES

	Virus	Substrate	Inactivation Temp. °C	Inactivation Time min	Reference
	(A)	(B)	(C)	(D)	(E)
37	Newcastle disease		56	5[4]	1
38			56	120	14
39	Poliomyelitis	Aqueous suspension	45-55	30	18
40			50-55	30	12
41		Milk, cream, ice cream	62	30	17
42		Milk	61.7	30	11
43			71.1	0.25	
44		Tissue suspension[1]	55	30	5
45		Water	50-55	30	11
46			75	30	3
47	Psittacosis		60	10	17
48	Rabies		50	60	3,12
49			56	30	19
50	Rabies		60	5	3,12
51			100	2-3	3
52		Aqueous suspension	54-60	60	17
53		Dry	54-56	1,440	17
54	Rift Valley fever	Blood	56	40	20
55	Small pox		55	30	17
56		Moist heat	60	10	3
57		Dry heat	100	10	3
58	Vaccinia	Dry	100	10	17
59		Fluid suspension	60	10	
60	Trachoma		45	15	17
61	Yellow fever		55	5	19
62			65	10	12

/1/ Mouse brain. /4/ Some strains 360 minutes.

116. EFFECT OF TEMPERATURE ON GROWTH AND SURVIVAL: RICKETTSIA AND BACTERIA

Values are for data obtained under diverse conditions by many investigators. Data may differ for various species within the same genus, and even for various cultures of the same species.

Part I. OPTIMUM TEMPERATURE FOR GROWTH

Bacteria may be grouped on the basis of their optimum growth temperatures; psychrophiles (optima below 20°C), mesophiles (optima from 21°-50°C), and thermophiles (optima above 50°C). These groupings are arbitrary and not mutually exclusive. Some bacteria, with optima below 50°C but which grow well at temperatures above 50°C, are not true thermophiles, as defined above, and are called thermoduric. Values in parentheses are for minimum and maximum temperatures at which growth can occur.

	Species	Temp. °C	Reference
	(A)	(B)	(C)
	Rickettsia		
1	*Bartonella bacilliformis*	28 (max. 37)	2,5,9,13
2	*Coxiella burneti*	35	11
3	*Miyagawanella lymphogranulomatis*	35-37	2
4	*Rickettsia prowazekii*	34-36 (30-37)	11
	Bacteria		
5	*Actinomyces bovis*	37 (20-40)	4
6	*Aerobacter aerogenes*	37 (2.5-45)	7
7	*Agrobacterium tumefaciens*	25-30 (0-37)	6,14
8	*Azotobacter chroococcum*	25-28	2
9	*Bacillus subtilis*	28-40 (max. 50-55)	2
10	*Brucella melitensis*	37 (6-45)	3
11	*Clostridium botulinum*	25 (20-35)	10
12	*Corynebacterium diphtheriae*	34-36 (15-40)	3
13	*Diplococcus pneumoniae*	37 (25-42)	3
14	*Erwinia carotovora*	25-30 (4-39)	6
15	*Escherichia coli*	30-37 (10-45)	2
16	*Lactobacillus acidophilus*	37 (22-48)	2
17	*Mycobacterium tuberculosis*	37 (30-42)	2,3
18	*Neisseria gonorrhoeae*	37 (30-39)	3,4
19	*Photobacterium fischeri*	25-28 (min. 5-10)	2
20	*Proteus vulgaris*	30-37 (good at 20)	3
21	*Pseudomonas aeruginosa*	37 (5-42)	13
22	*Rhizobium leguminosarum*	25	2,8,10
23	*Salmonella typhosa*	37 (4-40)	12
24	*Shigella dysenteriae*	37 (10-40)	5,13
25	*Staphylococcus aureus*	35-37 (10-42)	4
26	*Streptococcus pyogenes*	37 (10-42)	3
27	*Streptomyces griseus*	30-37	1,2
28	*Vibrio comma*	37 (16-42)	3
29	*Xanthomonas campestris*	30-32 (5-39)	6,14

116. EFFECT OF TEMPERATURE ON GROWTH AND SURVIVAL: RICKETTSIA AND BACTERIA

Part II. THERMAL DEATH TIME

Bacteria which do not form endospores are generally killed within 20 minutes when directly exposed in fluid to temperatures of 70°C or over (moist heat), but thermophiles are somewhat more resistant. Bacterial endospores may resist moist heat at 100°C for two minutes to many hours. However, no known living organism can survive compressed steam at 121°C (routine autoclaving) for 20 minutes. The thermal death times listed below are generally based on exposure to moist heat, unless otherwise specified. Inconsistencies in the values may be attributed to different experimental methods and to the fact that all of the variables, especially pH (a crucial factor), were not always reported. **Substrate** (column B): PS = phosphate solution; PW = peptone water.

	Species	Substrate	Temp. °C	Time min	Reference

118. TEMPERATURE TOLERANCES: ALGAE

Most values were based on observations of algae growing in their natural habitat. Since it is difficult to determine true temperature under such conditions, and since light absorption may raise the temperature of an algal mass above that of its surroundings, the data should be interpreted with caution. Values in parentheses are temperatures for maximum growth rate.

119. SOIL pH: SPERMATOPHYTES

With good management, and if other factors are favorable, many of the plants listed will grow and develop satisfactorily outside the pH range indicated. Field crops and vegetables generally are not as sensitive to soil pH as are flowers and shrubs.

	Species (Common Name)	pH	Reference
	(A)	(B)	(C)
	Gymnospermae		
1	*Abies* spp. (fir)	4.5-6.5	4
2	*Ginkgo biloba* (ginkgo)	5.5-7.0	4
3	*Juniperus virginiana* (eastern red cedar)	5.0-8.0	4
4	*Larix* spp. (larch)	4.5-7.5	4
5	*Picea* spp. (spruce)	4.5-6.5	4
6	*Pinus* spp. (pine)	4.5-6.5	4
7	*Taxus* spp. (yew)	5.0-7.5	4
8	*Thuja occidentalis* (northern white cedar)	6.0-7.5	3
9	*Tsuga canadensis* (eastern hemlock)	4.5-6.0	4
	Angiospermae (Monocotyledoneae)		
10	*Allium cepa* (garden onion)	6.0-7.5	4
11	*Asparagus officinalis* (garden asparagus)	6.0-8.0	3
12	*Avena sativa* (common oat)	5.0-7.5	2,3
13	*Gladiolus* spp. (gladiolus)	6.0-8.0	1
14	*Hordeum vulgare* (barley)	6.0-7.5	4
15	*Iris* spp. (iris)	6.0-8.0	1
16	*Lilium longiflorum* (Easter lily)	6.0-7.0	3
17	*Oryza sativa* (rice)	5.0-6.5	2,3
18	*Phleum pratense* (timothy)	6.0-8.0	3
19	*Poa pratensis* (Kentucky bluegrass)	5.5-7.5	2,3
20	*Tradescantia virginiana* (Virginia spiderwort)	5.0-7.5	3
21	*Triticum aestivum* (wheat)	5.5-7.5	2
22	*Zea mays* (corn)	5.5-7.5	2,3
	Angiospermae (Dicotyledoneae)		
23	*Acer* spp. (maple)	5.5-7.5	4
24	*Alnus* spp. (alder)	6.0-7.5	4
25	*Antirrhinum majus* (snapdragon)	6.0-7.5	3
26	*Beta vulgaris* (common beet)	6.0-7.5	3
27	*Betula lenta* (sweet birch)	4.5-6.0	4
28	*Capsicum frutescens* (bush red pepper)	5.5-7.0	1
29	*Carya ovata* (shagbark hickory)	6.0-6.5	4
30	*Catalpa* spp. (catalpa)	6.0-7.5	4
31	*Chrysanthemum morifolium* (florist's chrysanthemum)	6.0-7.5	3
32	*Citrus limon* (lemon)	6.0-7.5	3
33	*C. sinensis* (sweet orange)	6.0-7.5	3
34	*Cornus florida* (flowering dogwood)	5.0-6.5	4
35	*Cucumis sativus* (cucumber)	5.5-7.0	3
36	*Cucurbita pepo* (pumpkin)	5.5-7.0	1
37	*Daucus carota* (carrot)	5.5-7.0	3
38	*Fagopyrum esculentum* (buckwheat)	5.5-7.0	2,3
39	*Fagus sylvatica* (European beech)	6.0-7.5	4
40	*Fragaria* spp. (strawberry)	5.0-6.5	1,3
41	*Glycine soja* (soybean)	6.0-7.5	4
42	*Gossypium hirsutum* (upland cotton)	5.0-6.5	4
43	*Helianthus annuus* (common sunflower)	6.0-7.5	2,3
44	*Ilex aquifolium* (English holly)	5.0-6.5	4
45	*Ipomoea batatas* (sweet potato)	5.0-6.5	4
46	*Juglans* spp. (walnut)	6.0-7.5	4
47	*Lactuca sativa* (lettuce)	6.0-7.5	4
48	*Lycopersicon esculentum* (tomato)	5.5-7.5	3
49	*Magnolia grandiflora* (southern magnolia)	5.0-7.0	1
50	*Malus pumila* (common apple)	5.0-6.5	3
51	*Medicago sativa* (alfalfa)	6.2-7.8	2,3
52	*Nicotiana tabacum* (common tobacco)	5.5-7.5	2,3
53	*Oenothera biennis* (common evening primrose)	6.0-8.0	3
54	*Phaseolus vulgaris* (kidney bean)	6.0-7.5	2,3
55	*Pisum sativum* (garden pea)	6.0-8.0	1
56	*Populus tremuloides* (quaking aspen)	4.5-5.5	4
57	*Prunus persica* (peach)	6.0-7.5	3
58	*Pyrus communis* (pear)	6.0-7.5	3
59	*Quercus alba* (white oak)	6.0-8.0	1
60	*Raphanus sativus* (garden radish)	5.5-7.0	4
61	*Rhododendron obtusum amoenum* (amoena azalea)	4.5-6.0	3
62	*Rosa* sp. (hybrid tea rose)	5.5-7.0	3
63	*Salix* spp. (willow)	5.5-7.5	4
64	*Solanum tuberosum* (potato)	5.0-6.5	2,3
65	*Trifolium pratense* (red clover)	6.0-7.5	2,3
66	*Ulmus americana* (American elm)	6.0-8.0	1
67	*Vicia faba equina* (horsebean)	6.0-7.0	3
68	*Vitis* spp. (grape)	6.0-8.0	1

121. EFFECT OF LIGHT ON DEVELOPMENT: ANGIOSPERMS

Part I. VARIOUS WAVELENGTHS

Data present the effectiveness of brief interruption of the dark period to control flowering and certain vegetative expressions. Plants were grown under radiation from carbon arc and incandescent filament lamps for a daily period of approximately 12 hours. Midpoint in the dark period they were exposed to radiation of known energy and wavelength.

	Effect and Species (Common Name)	Relative Energy Normalized to Maximum Response at Wavelength (Ångstrom Units) of											Conversion Factor[1]	Reference

122. PHOTOPERIOD, WITH TEMPERATURE INTERACTIONS, FOR FLOWERING: ANGIOSPERMS

Varietal differences account for multiple photoperiodic classifications (column B); the common classification has been given priority in listing. Classification is followed in parentheses by the light period for flowering (>12 hr should be interpreted as 12 hours or more, <12 hr as up to 12 hours). **Temperature Interactions** (column C): Th = photoperiodic response occurring at relatively high temperatures (plant may also flower at other day lengths at lower temperatures), or reproductive development promoted by high temperatures during photoperiodic induction; Tl = photoperiodic response occurring at relatively low temperatures (plant may also flower at other day lengths at higher temperatures), or reproductive development promoted by low temperatures during photoperiodic induction; Tp = thermoperiodic (i.e., development affected by alternation of temperature between day and night periods); Tq = quantitative effect of temperature on critical day length (i.e., an increase in temperature lowers the minimum limits for long-day plants and raises the maximum limits for short-day plants), or on the degree of photoperiodic response; Ve = vernalization essential for complete reproductive development (or other low-temperature preconditioning of embryo plants, seedlings, buds, or plants), prior to photoperiodic induction; Va = vernalization not essential but promotes reproductive development; Vo = vernalization not effective. For additional information, consult references 5, 15, 30, 35, 45, and 54.

	Species (Common Name)	Photoperiodic Class and Light Period	Temperature Interactions	Reference

123. FACTORS AFFECTING PROTOPLASMIC STREAMING: PLANTS

Protoplasmic streaming as considered in this table includes shuttle-type flow of protoplasm in slime molds, protoplasmic streaming within rigid cell walls of Algae, and cyclosis in Monocotyledoneae. Many techniques were used to study streaming rates, and the results vary according to the methods and conditions of measurement. Values were interpolated where necessary from graphic and tabular data in the literature.

PART I. TEMPERATURE

	Species (Common Name)	Rate of Streaming, μ/sec 5°C	10°C	15°C	20°C	25°C	30°C	35°C	40°C	Reference

Part III. LIGHT INTENSITY: AVENA COLEOPTILE

Nonchlorophyll-containing cells of *Avena* coleoptile were observed in the orange-red, phototropically inactive spectral region after exposure to various doses of blue light (4,360 Å), at 23°C. Data show the fitness of the "product rule" (intensity x time), as well as the effect of total energy (dosage). **Reaction** (column D) = the algebraic sum of percent departures from normal rate; negative values indicate a decrease in streaming, and positive values, an increase.

	Dosage[1] ergs per sq cm	Illumination: Intensity ergs per sq cm per sec	Illumination: Time sec	Reaction[2]

126. MAXIMUM PERMISSIBLE OCCUPATIONAL EXPOSURE TO RADIATION: MAN

Part I. DOSE EQUIVALENT TO BODY ORGANS

Values are the recommended permissible doses of ionizing radiation to the various organs of the body of the occupational worker, and are in addition to doses from medical and background exposure. The values apply to both external and internal exposure. The unit of dose equivalent used in this table is the rem. No. of rem = no. of rad x RBE x n. (Rad = unit of absorbed dose; 1 rad corresponds to 100 ergs/g of medium. RBE = relative biological effectiveness, i.e., ratio of absorbed dose, in rads, from reference X rays to the absorbed dose, in rads, from the given radiation field required to produce the same effect as the reference X rays. Reference X rays in most cases have been those from 200-250 kilovolts X-radiation or γ-radiation from Co^{60}. n = relative damage factor.) DE = dose equivalent.

	Body Organ	Maximum DE in Any 13 Wk[1] rem/13 wk	Average DE in 1 Yr[2] rem/yr	Accumulated DE for Ages >18 Yr[3] rem
	(A)	(B)	(C)	(D)
1	Total body	3	5	5(age-18)
2	Head and trunk	3	5	5(age-18)
3	Lenses of eyes	3	5	5(age-18)
4	Blood-forming organs	3	5	5(age-18)
5	Gonads	3	5	5(age-18)
6	Bone	10	30	30(age-18)
7	Skin	8-10	30	30(age-18)
8	Thyroid	8-10	30	30(age-18)
9	Feet, ankles, hands, & forearms	20-25	75	75(age-18)
10	Other single organs	4-5	15	15(age-18)

/1/ These values may be used for the accumulated short-term exposures in any 13-week interval. /2/ These values may be used for a planned emergency exposure. /3/ To determine accumulated dose equivalent, multiply value times age minus 18 years.

Contributor: Morgan, Karl Z.

Reference: Morgan, K. Z. 1963. Science 139:565.

Part II. TYPE OF RADIATION

All values in columns C and D may be increased by a factor of 6 if the exposure is primarily to the bone, skin, or thyroid. They may be increased by a factor of 3 if the exposure is limited to organs other than the eyes, gonads, or blood-forming organs.

	Type of Radiation	QF[1]	Average Exposure Rate[2] mrad/wk	Approximate Flux to Give a Maximum Permissible Exposure in an 8-Hour Day[3]
	(A)	(B)	(C)	(D)
1	X and γ rays	1	100	$\frac{1400}{E}$ photons per sq cm per sec in free air at 0°C (error <13% for E = 0.07-2 Mev)

/1/ Quality factor, a term used to express the modification of RBE due to LET (linear energy transfer of the radiation), n (relative damage factor), and other conditions. /2/ Permissible to eyes, gonads, and blood-forming organs (essentially total body exposure) of individuals 18 years or older. These values may be averaged over a year, provided the dose equivalent in any 13 weeks does not exceed 3 rem (rem = rad x QF). /3/ Rate based on a 20-mrem dose equivalent delivered to tissue in an 8-hour day (= 2.5 per QF mrad per hr). The rad in soft tissue is considered to correspond to an energy absorption of 100 ergs/g. Mev = one million electron volts.

126. MAXIMUM PERMISSIBLE OCCUPATIONAL EXPOSURE TO RADIATION: MAN

Part II. TYPE OF RADIATION

	Type of Radiation	QF[1]	Average Exposure Rate[2] mrad/wk	Approximate Flux to Give a Maximum Permissible Exposure in an 8-Hour Day[3]
	(A)	(B)	(C)	(D)
2	β rays and electrons	1	100	$\frac{4.3 \times 10^7}{(QF)P}$ electrons or β rays per sq cm per sec incident on tissue (≃23 electrons or 15 β per sq cm per sec of 1 Mev energy)
3	Thermal neutrons	2.5	40	700 thermal neutrons per sq cm per sec incident on tissue
4	Fast neutrons	10	10	19 neutrons of 2 Mev energy per sq cm per sec incident on tissue
5	α particles	10	10	$\frac{4.3 \times 10^7}{(QF)P}$ α particles per sq cm per sec incident on tissue (≃0.005 α particles of 5 Mev per sq cm per sec)
6	Protons	10	10	$\frac{4.3 \times 10^7}{(QF)P}$ protons per sq cm per sec incident on tissue (≃0.06 protons of 5 Mev per sq cm per sec)
7	Heavy ions	20	5	$\frac{4.3 \times 10^7}{(QF)P}$ heavy ions per sq cm per sec (≃0.0002 oxygen ions of 5 Mev per sq cm per sec)

/1/ Quality factor, a term used to express the modification of RBE due to LET (linear energy transfer of the radiation), *n* (relative damage factor), and other conditions. /2/ Permissible to eyes, gonads, and blood-forming organs (essentially total body exposure) of individuals 18 years or older. These values may be averaged over a year, provided the dose equivalent in any 13 weeks does not exceed 3 rem (rem = rad x QF). /3/ Rate based on a 20-mrem dose equivalent delivered to tissue in an 8-hour day (= 2.5 per QF mrad per hr). The rad in soft tissue is considered to correspond to an energy absorption of 100 ergs/g. The *P* is the stopping power in units of electron volts per g per sq cm of soft tissue. Mev = one million electron volts.

Part III. INTERNAL CONCENTRATION OF RADIONUCLIDES

Values are for radionuclides ingested (in water) or inhaled (in air). Any mixture of the radionuclides listed is considered permissible if the accumulated body burden in any organ, or the concentration in the contents of the gastrointestinal tract, does not reach a value that delivers a dose exceeding the maximum permissible dose-rate of 0.3 rem per week. **Type of Decay** (column C): α = alpha particle; β^- = negatron; β^+ = positron; γ = gamma ray; e^- = internal conversion electron; ϵ = orbital electron capture; SF = spontaneous fission. **Radionuclide** (column D): s = soluble compounds of the radionuclide; i = insoluble compounds of the radionuclide. **Critical Organ** (columns F and I): GI = gastrointestinal tract; (S) = stomach; (SI) = small intestine; (ULI) = upper large intestine; (LLI) = lower large intestine. μc = microcurie, one millionth of a curie or 3.7×10^4 disintegrations per second.

/1/ Z = atomic number. /2/ Maximum permissible burden in the total body resulting from maximum permissible concentration of the radionuclide in water or food when deposited in the critical organ (columns F and I). When other footnote numbers appear in column E, "q" pertains only to the critical organ specified in the footnote. /3/ That organ receiving the radiation dose that results in the greatest damage to the body. /4/ For total body. /5/ Also lung. /6/ For liver. /7/ Also lower large intestine. /8/ For spleen. /9/ Also total body. /10/ Also prostate. /11/ Also liver. /12/ For prostate.

127. LATE EFFECTS OF IRRADIATION: MAMMALS

Radiation (columns A and B): c = curie, the quantity of radioactive nuclide in which the number of disintegrations is 3.7 x 10^{10}/sec; mc = millicurie, 1/1,000 of a curie or 3.7 x 10^{7} disintegrations/sec; µc = microcurie, one millionth of a curie or 3.7 x 10^{4} disintegrations/sec; ev = electron volt, the energy imparted to an electron when it is accelerated through a potential difference of one volt (1.602 x 10^{-12} ergs); Mev = one million electron volts, a unit of energy equal to 1.6 x 10^{-6} ergs; kv = kilovolt, a unit of electrical potential equal to 1,000 volts; n = neutron, a nuclear particle of zero charge and mass number 1; r = roentgen, the quantity of X- or α-radiation such that the associated corpuscular emission per 0.001293 g of air produces, in air, ions carrying one electrostatic unit of electrical charge of either sign; rep = roentgen equivalent physical, the equivalent of 93 ergs/g energy absorption; rem = roentgen equivalent man (or mammal), the quantity of radiation absorbed in tissue, which gives the same observable effect as one rep of X or γ rays; rad = unit of absorbed dose (1 rad corresponds to 100 ergs/g of medium); RBE = relative biological effectiveness, i.e., ratio of absorbed dose, in rads, from reference X rays to the absorbed dose, in rads, from the given radiation field required to produce the same effect as the reference X rays (reference X rays in most cases have been those from 200-250 kv X-radiation or γ-radiation from Co^{60}). **Late Effects** (column D): figures separated by a slash (e.g., 13/16) give the number of individuals affected and number exposed. *Symbols:* > = greater than; ≥ = greater than or equal to; ≤ = less than or equal to.

	Radiation: Type	Radiation: Exposure	Latent Period	Late Effects	Reference
	(A)	(B)	(C)	(D)	(E)
			Man		
1	A-bomb	Epilation dose	2 yr	A-bomb cataract: Japan, 10 cases; USA, 1 case.	13,15
2	Hiroshima	Irradiated in utero, 1st half of pregnancy	5 yr	Microcephaly and mental retardation, 7/11 children within 1,200 m of hypocenter.	58
3	Japan	Area within 2,000 m of hypocenter	3-5 yr	Leukemia incidence 9.3 times that of nonexposed population of Hiroshima and Nagasaki (1948-1950, inclusive).	23
4		Area within 1,000 m of hypocenter	3-5 yr	Leukemia incidence 32 times that of nonexposed population (1948-1950, inclusive).	
5	Cyclotron	Epilation dose	2 yr	Cyclotron-induced cataract, 2 cases.	13,15
6	16 Mev neutrons, fast	400-500 n	2 mo-5 yr	Severe epidermolytic reaction, 13/16: skin atrophy and fibrosis, persistent ulcerations, diminished repair by normal tissues. Radiation osteitis. Severe bowel reactions.	69
7	0-20 Mev neutrons, fast (small γ components)	10-135 n	2-10 yr	Cataracts: severe, 3/10; slight to moderate, 4/10; minimal, 3/10. Chronic irradiation: no blood changes; mild epilation, 2 cases.	1
8	γ rays and fission neutrons	22.8-365 rads to total body	29 mo	Gross chromosome aberrations of leukocyte cultures, % abnormal cells: 22.8 rads, 4%; 339 rads, 28.2%; 365 rads, 18%. Minor aberrations of grossly normal cells: 22.8 rads, 83%; 339 rads, 53%; 365 rads, 67%.	4,5
9			42 mo	Gross chromosome aberrations of leukocyte cultures, % abnormal cells: 22.8 rads, 20%; 339 rads, 19%; 365 rads, 23%. Minor aberrations of grossly normal cells: 22.8 rads, 0%; 339 rads, 50%; 365 rads, 30%.	
10	Nuclear and allied radiations		6-8 yr	Peak incidence of leukemia.	49
11			After 10th yr	Diminishing incidence of leukemia; increasing incidence of other cancers.	
12	Radium (external)	1,000-1,500 mg-hr		Cessation of ovarian function, 77%/63.	57
13		1,500-2,000 mg-hr		Cessation of ovarian function, 6/7.	
	Radium[1]	Residual (ingested)			2,48, 75, 76
14		0.02-0.5 µg	14-48 yr	Radiation osteitis, 25%.	
15		0.5-2.0 µg	1-32 yr	Osteomyelitis of jaw and loss of teeth, 5/9; radiation osteitis, 8/9; pathological fractures, 3/9; giant cell tumor, 1/9; osteogenic sarcoma, 1/9; epidermoid carcinoma of nasopharynx, 1/9. High incidence of deafness and arthritis.	
16		2.7 µg	8-32 yr	Osteomyelitis of jaw and loss of teeth, 5/9; radiation osteitis, 8/9; pathological fracture, 1/9; fibrosarcoma, 1/9; epidermoid carcinoma of nasopharynx, 1/9.	
17		2-20 µg	6-8 yr	Radiation osteitis (osteosclerosis); osteogenic sarcoma deaths, 5/18; pathological fractures.	

/1/ Variable amounts of mesothorium also present in some instances.

	Radiation		Latent Period	Late Effects	Reference
	Type	Exposure			
	(A)	(B)	(C)	(D)	(E)
	Man				
	Radium[1]	Residual (ingested)			
18		8-23 µg	7-21 yr	Osteomyelitis of jaw and loss of teeth, 6/8; radiation osteitis, 7/8; epidermoid carcinoma of nasopharynx, 1/8; osteogenic carcinoma, 1/8; pathological fractures, 3/8; leukemia, 1/8.	2,48, 75, 76
19		10-180 µg	1-8 yr	Anemia with hyperplastic marrow, jaw necrosis (13 cases).	
20		Residual, 1.0-10.0 µg (equivalent to 100-800 µg original dose)	20-30 yr posttreatment	24 cases: changes in bone density (similar to those in dead or dying bone) in patients having at least 1 µg; minimal changes with 0.5 µg; dental changes in all with at least 4 µg. Greatly enlarged haversian canals. Distortion of normal bone configuration, 7/24; edentia, mandibular lesions, 3/19; aseptic necrosis of bone, 7/24; fibrosarcoma, honeycombed teeth (pink tooth).	43
21	Uranium, radium ores	Variable doses	13-23 yr	Lung cancer in uranium miners of Joachimsthal and Schneeberg.	28,40
22	X ray	Variable doses	Months to years	Skin atrophy, telangiectasis, sclerosis, pigmentation, alopecia, altered vasomotion, diminished sweat and sebaceous function, loss of cutaneous ridges and fingerprints, ulcers and keratoses, malignancies, hyperkeratotic warty growths, deformed and brittle dry nails, loss of nails, fissures, subungual hyperkeratoses.	3,28, 51, 75, 76
23		Varied exposures (diagnostic radiology)		One leukemic death for every 46,000 X-ray examinations in Great Britain.	72
		Irradiation in utero		Incidence of leukemia and cancer per 10,000 children	45
24		No exposure		Leukemia--firstborn, 4.7; others, 3.6; all, 4.0. Cancer of CNS, 1.6; other cancers, 1.8.	
25		Exposed		Leukemia--firstborn, 6.9; others, 4.6; all, 6.1. Cancer of CNS, 2.5; other cancers, 2.5.	
26		1 or 2 films		Leukemia, 3.8; cancer of CNS, 2.7; other cancers, 2.7.	
27		Pelvimetry		Leukemia, 6.9; cancer of CNS, 2.3; other cancers, 2.1.	
28		100-300 r (200 & 1,000 kv)	60-680 da	Temporary drop in WBC count.	70
29			100-600 da	Temporary macrocytic anemia.	
30		500-624 r		94% castrated.	57
31		625 r to ovaries		Permanent cessation of menstruation, 72 patients.	
32		≦1,000 r to center of vertebrae	Followed 13 yr posttreatment	Vertebrae normal (irrespective of age), 45 children.	50,75, 76
33		1,000-2,000 r to spine	Followed 3-7 yr	"Transverse-line" growth disturbance of vertebrae (irrespective of age up to 6 yr), 45 children.	
34		Approximately 2,000 r to spine	Followed 2-13 yr	Contour irregularity of vertebrae, 44/45 children.	
35		1,500-8,500 r (therapeutic dose, eye tumor)	2 yr	Cataract, 7 cases.	13,15
36		3,500-5,000 r	8-28 mo	Lens opacities, 4 cases.	41
37		1,500-25,000 r (130-200 kv)	6-22 yr	Osteogenic sarcoma, 11 cases.	12
38		1,700-3,000 r (half-value layer 1.5 cu mm) to lower abdomen	6-18 mo	Nephrosclerosis, hypertension, elevated albuminuria, 22/55. Edema, anuria. Death from congestive heart failure and/or uremia, 7/55. Over 2,300 r, high risk of renal failure.	33
39	X ray, radium	4,000-6,700 r	5-20 yr	Sarcoma; osteogenic sarcoma. Therapy for lupus vulgaris, papillomata of bladder, actinomycosis, tubercular psoriasis.	30

	Type	Exposure			
	(A)	(B)	(C)	(D)	(E)
			Man		
40	X-ray and radium equipment	Unknown		Leukemia in radiologists (4.68%), 9 times the incidence in nonradiological physicians (0.51%).	20,47, 74
			Dog		
41	Neutrons	0.012, 0.06, 0.11 n/da	1 yr	Reduction of lymphocytes only observed effect (dose given 6 da/wk).	7
42		1.7 n/da	1 yr	Mucoid conjunctivitis, keratoconjunctivitis and corneal opacities; reduced size of spleen and testes; increased incidence of infection; hypoplasia of bone marrow and regional lymph nodes; hemorrhage of lymph nodes, heart, stomach, small bowel and kidney; reduction of lymphocytes, neutrophils, and erythrocytes.	
43	Neutrons, fast	150 n	2 yr	Destruction and chronic inflammation of cornea, and changes in lens capsules and fibers, but no cataracts.	53
44		800-900 n	2 yr	Cataracts 60-75% of subjects.	
45	X ray	0.1 r/da (6 times/wk)	2 yr	Lowered sperm count, increase in abnormal sperm.	7
46		0.5 r/da	11 mo	Lowered sperm count, increase in abnormal sperm.	
47			2 yr	Partial testicular atrophy; slight reduction of lymphocytes.	
48		1.0 r/da	6 mo	Lymphopenia.	
49			9 mo	50% aspermic[a].	
50			1 yr	100% aspermic[a]; neutrophil reduction.	
51			2 yr	Severe injury of testes[a].	
52		3.0 r/da	2 mo	Lymphocyte and platelet reduction.	
53		6.0 r/da	9 mo	50% aspermic.	
54			1.5 yr	Severe injury of testes.	
55		10.0 r/da	2 mo	Lymphocyte, platelet, & erythrocyte depression.	
56			3.5 mo	50% aspermic.	
57			1.5 yr	Bone marrow hypoplasia; focal bowel and lymph node hemorrhages.	
58			6 mo	50% survival.	
			Guinea Pig		
59	Cobalt-60 (γ rays), external	15 r/da	106 da	50% survival.	73
60		30 r/da	63 da		
61		60 r/da	41 da		
62		90 r/da	20 da		
63		120 r/da	18 da		
64	Phosphorus-32	7,750 rep (external)	2 mo	Alopecia.	78
65	Radium, filtered (γ rays), repeated low dose	Nonradiated (controls)	38 mo	75% survival.	29,44, 70
66		0.11 r/da	38 mo	75% survival.	
67		1.1 r/da (1,050 r)	32 mo	50% survival.	
68		2.2 r/da (2,100 r)	32 mo	50% survival.	
69		4.4 r/da (2,400 r)	18 mo	50% survival; reduction of WBC.	
70		8.8 r/da (2,300 r)	5 mo	50% survival; recurrent anemia.	
			Mouse		
71	Carbon-14	100 μc sodium formate of C-14, intraperitoneally during gestation	Until parturition	Normal litters; offspring show no differences from controls in weight, longevity, or tumor incidence. No lowered fertility.	68
72	Cesium-137 (γ rays)	258 r to total body before mating	Until parturition	Reduced size of litters: age at mating, 60-79 da--controls, 14.08; irradiated, 9.16; age at mating, 80-99 da--controls, 30.8; irradiated, 8.63; age at mating, 110-119 da--controls, 12.8; irradiated, 7.68; age at mating, 120-139 da--controls, 12.05; irradiated, 6.59.	26
73	Cobalt-60 (γ rays), external	90 r/da	52 da	50% survival.	73
74		115 r/da	37 da		
75		140 r/da	22 da		

/a/ If irradiation is stopped after one year, there is partial recovery of sperm four months later.

127. LATE EFFECTS OF IRRADIATION: MAMMALS

	Radiation: Type	Radiation: Exposure	Latent Period	Late Effects	Reference
	(A)	(B)	(C)	(D)	(E)
	Mouse				
	Deuteron beams	Brain region			56
76		1-mm beam at 8,000 rads to cerebellum	2-7 mo	Significant variation in locomotor activity wheel tests & escape-avoidance conditioning.	
77		1-mm beam at 8,000 rads to both parietal regions	7 mo	Large lesions at end of Bragg zone owing to disappearance of nerve cell bodies, leaving fluid-filled cavities without structural detail.	
78	Neutrons, fast	2 rads/da, 2.24 neutron high, 0.287 neutron low; γ-irradiation--16 rads/da, 15.8 high, 2.26 low		Life shortening; RBE 10.	55
79	Neutrons, fast, or Cobalt-60 (γ rays)	3-50 rems daily		Life shortening; RBE independent of exposure time and may vary with dose rate.	52
80	Neutrons, fast (4 Mev); X ray (200 kv)	1 exposure		Cataractogenesis; RBE 4.	18,62, 63
81		3 exposures		Cataractogenesis; RBE 6.	
82	Neutrons, fast, 10^3 ev to ≥4 Mev, and γ rays (divided doses)	Nonradiated (controls)	51 wk	50% survival for controls and each dosage increment. For shortening life span, 1 n (divided small doses) is equivalent to 35 r. (For acute killing, 1 n is equivalent to 9 r.) Threshold for shortening life span is approximately 1 r/da and less than 0.1 n.	27
83		1 r/da	61 wk		
84		8.6 r/da	48 wk		
85		Nonradiated (controls)	70 wk		
86		0.115 n/da (total 32.2 n)	40 wk		
87		1.15 n/da (total 241.5 n)	30 wk		
88		4.3 n/da (total 301 n)	10 wk		
89		13 n/da (total 273 n)	3 wk		
90	Neutrons, fast, and X rays (single exposure)	Nonradiated (controls)	64 wk	50% survival for controls and each dosage increment. Terminal changes generalized. Atrophy. Increased incidence of mediastinal lymphomatosis.	27
91		500 r	58 wk		
92		700 r	39 wk		
93		26 n	52 wk		
94		50 n	48 wk		
95		78 n	42 wk		
96		90 n	6 wk		
97	Phosphorus-32	3,000-4,000 rep (external)	30 da	General epilation, skin atrophy, loss of ear tips, ulcerations, keratosis.	61,78
98			3-4 mo	Lens opacities (4,000 r).	
99			8 mo	Lens opacities (3,000 r).	
100			6-8 mo	Tumors; shortening of life span.	
101	Plutonium-239	3.1-15.6 μc/kg (iv)	190-250 da	Osteogenic sarcoma.	11,75, 76
102		>6.1 μc/kg (iv)		Marked shortening of life span.	
103	Radium-226	>12 μc/kg (iv)	250-300 da	Increased osteogenic sarcoma.	11,75, 76
104		>50 μc/kg (0.6-4,170 μc/kg, iv)		Marked shortening of life span: debilitation and increased incidence of infection.	
105	Radium, filtered (γ rays), repeated low dose	Nonradiated (controls)	24 mo	50% survival for controls and each dosage increment; increase in lymphatic leukemia, mammary and ovarian carcinoma.	44
106		1.1 r/da (760 r)	24 mo		
107		2.2 r/da (1,390 r)	22 mo		
108		4.4 r/da (2,640 r)	21 mo		
109		8.8 r/da (4,400 r)	17 mo		
	Strontium-89 (β rays)				10
110	Monthly injections	0.05 μc/g	500 da	Bone tumors begin to develop.	
111		0.1 μc/g	425 da		
112		0.2 μc/g	350 da		
113		0.5 μc/g	220 da		
114		1.0 μc/g	160 da		
115	Single injection	2.5 μc/g	200 da		
116		5.0 μc/g	150 da		
117	Uranium-232	0.1-1.0 μc/kg (iv)	575 da	Osteogenic sarcoma (probably significant); used 0.1-10.0 μc/kg.	11,75, 76
118		>1.0 μc/kg (iv)	575 da		
119	Uranium-233	2-5 μc/kg (iv)	575 da	Osteogenic sarcoma (probably significant); used 0.1-100 μc/kg.	11,75, 76
120		>5 μc/kg (iv)	575 da	Osteogenic sarcoma.	
121		>53 μc/kg (iv)	575 da	Shortening of life span.	
122	Uranium-238	>3.6 x 10^{-7} μc/kg (iv)	575 da	Possibly significant increase in osteogenic sarcoma.	11,75, 76

continued

127. LATE EFFECTS OF IRRADIATION: MAMMALS

	Radiation: Type (A)	Radiation: Exposure (B)	Latent Period (C)	Late Effects (D)	Reference (E)
			Mouse		
123	X ray	25-200 r to fetus early in pregnancy (equivalent to 2-6 wk, human)	Until birth	At birth, severe skeletal and other abnormalities, with clearly defined critical periods.	65
124		Irradiation of fetus late in pregnancy (equivalent to after 6 wk, human)	Until birth	Several weeks after birth: cataracts, hydrocephalus, behavior disturbances, skin lesions.	
125		400 r (single dose)	15-23 mo	Ovarian tumors 15 times that of controls.	25
126		600-1,000 r (divided doses)	9-14 mo	Myelosis 8 times that of controls.	
127			6-12 mo	Mediastinal lymphosarcoma 7 times that of controls.	
128	X ray (120 kv)	Nonradiated (controls)	526-570 da	Lymphomas, 3/36	31
129		600 r (150 r alternate weeks) to whole body	420-580 da	Lymphomas, 33/63.	
130		600 r (150 r alternate weeks) to whole body, mediastinum shielded	118-525 da	No lymphomas.	
131		1,200 r (300 r alternate weeks) to upper half of body	324-365 da	Lymphomas, 3/40.	
132		1,200 r (300 r alternate weeks) to alternate halves of body	420-508 da	Lymphomas, 3/37.	
133	X ray (250 kv)	50 r	17 wk	Lens opacities, 59% at 30 wk[a].	71
134		200 r	14 wk	Lens opacities, 100% at 22 wk[a].	
135		500 r	6 wk	Lens opacities, 100% at 17 wk[a].	
136		100 r to whole body	3 mo	Shortening of life span, 7%.	17
137		100-300 r to whole body	3 mo	Increase in thymic lymphoma.	
138		300 r to whole body	3 mo	Increase in myeloid leukemia; shortening of life span, 21%.	
139		300 r to head	3 mo	Ocular lens cataracts, 40%; shortening of life span, 2%.	
140		300 r to middle third of body	3 mo	Shortening of life span, 3%.	
141		300 r to lower third of body	3 mo	Increase of ovarian tumors; shortening of life span, 4%.	
142		260-520 r (1-4 exposures, males & females 164-730 da old)	Death	Life span shortened 4.6-26.2% for males, 8.8-36.5% for females.	32
143		550 r to whole body	5-6 mo	Decrease in fat of skin of female; permanent depression of DNA synthesis relative to RNA in kidneys of both sexes.	24
144		500 r, 550 r, 600 r (females 10 wk old)		Increased incidence of thymic lymphomas and ovarian tumors; greater severity of lens opacities than in controls.	16
145		750 r to whole body	6-10 mo	Weight reduction in body, heart, kidneys, and testes; increase in fat content of carcass.	22
			Rat		
146	Cerium-144	1-3 mc/kg	200 da	Osteogenic sarcoma, liver atrophy with ascites and jaundice.	42
147	Cobalt-60 (γ rays), external	20 r/da	332 da	50% survival; increased tumor frequency.	73
148		60 r/da	236 da		
149		70 r/da	72 da		
150		80 r/da	53 da		
151		90 r/da	48 da		
152		120 r/da	38 da		
153	Cobalt-60 (γ rays)	110 r (13-15th & 16-18th da of gestation)	Until parturition	Neonatal death rate higher.	54
154		150 r (14th & 20th da of gestation)			

/a/ The RBE of thermal neutrons calculated on the basis of the production of lens opacities was approximately nine time the RBE calculated on the basis of the production of lethality at 30 days.

127. LATE EFFECTS OF IRRADIATION: MAMMALS

	Radiation		Latent Period	Late Effects	Reference
	Type	Exposure			
	(A)	(B)	(C)	(D)	(E)
			Rat		
155	Cobalt-60 (γ rays)	220 r (12-16th & 17-20th da of gestation)	Until parturition	Neonatal death rate higher; average weaning weight lower in all irradiated groups; ovulation 20% in irradiated females; mature body and testes weight lower in irradiated males.	54
156	Neutrons	0.012-0.060 n/da	1 yr	No effects observed.	7
157		0.11 n/da	1 yr	Number of neoplasms 3 times that of controls (including leukemias).	
158		1.7 n/da	1 yr	Increased infection and incidence of neoplasms (high leukemia incidence); bilateral cataracts; hypoplasia of spleen; atrophy of testes and ovarian follicles; early reduction of lymphocytes; reduction of erythrocytes.	
159	Phosphorus-32	4,000-5,000 rep (external)	4-5 mo	Tumors, keratoses, lens opacities (low incidence), ulceration of scrotum and base of tail, alopecia.	78
160	Praseodymium-144	1-3 mc/kg	200 da	Osteogenic sarcoma, liver atrophy with ascites and jaundice.	42
161	Plutonium-239	0.02 μg/g (0.0031-0.0062 c/g)	300-400 da	Osteogenic sarcomas.	60
162		0.03 μc/g	3-7 mo	Areas of dead bone and calcified cartilage; resumption of normal bone growth at epiphysis; destruction of spermatogenic cells, atrophy of ovary.	8
163	Radium	0.125 μc/g	5 mo	Damage to epiphyseal cartilage, overgrowth with atypical bone, loss of normal bone cells; atrophy of ovary.	8,75, 76
164		0.5 μc/g	3-6 mo	Degenerative changes in ovary; damage to blood vessels.	
165		0.6 μc/g	5 mo	Damage to epiphyseal cartilage and marrow; production of abnormal bone.	
166	Strontium-89	0.05 μc/g	500 da	Osteogenic sarcomas.	60
167		0.1 μc/g	400 da		
168		0.5 μc/g (single injection)	400 da		
169		1.0 μc/g level (monthly injections)	250 da		
170		5.0 μc/g (single injection)	200 da		
	Strontium-90	10-30 da in drinking water			26
171		Total dose, 33 μc; skeletal burden, 1 μc (425 da old)	380 da	No leukemia; no osteogenic sarcoma.	
172		Total dose, 650 μc; skeletal burden, 2 μc (346 da old)	372 da	0.0007 leukemia/rat/wk; no osteogenic sarcoma.	
173		Total dose, 790 μc; skeletal burden, 11 μc (117 da old)	254 da	Moderate bone marrow damage; 0.0017 leukemia/rat/wk; 0.0076 osteogenic sarcoma/rat/wk.	
174		Total dose, 464 μc; skeletal burden, 33 μc (40 da old)	106 da	Atrophy of bone marrow cells; no leukemia; 0.023 osteogenic sarcoma/rat/wk.	
175	Thorium dioxide (α and γ rays)	0.3 ml	14 mo	Produced fibroblastic tumors, 14/60.	28
176		2.5 ml	10-17 mo	Produced sarcoma, 33/50.	
177		5.0 ml	10-17 mo	Produced sarcoma, 50/50.	
178	X ray	0.1 r/da (total 49 r)	81.7 wk	50% survival.	7
179		0.5 r/da (total 230 r)	76.7 wk	50% survival; increase in fibroadenoma of mammary gland.	
180		1.0 r/da (total 460 r)	76.9 wk	50% survival.	
181		10.0 r/da (total 3,500 r)	58.3 wk	50% survival; increase in leukemia.	
182		12.5-100.0 r (8th da of gestation)		Retardation of growth.	77
183		12.5-100.0 r (9th & 10th da of gestation)		Malformations, increased mortality, growth retardation.	
184		≥375 r to whole body		Enamel hypoplasia, retarded enamel dentin formation.	3,75, 76

continued

127. LATE EFFECTS OF IRRADIATION: MAMMALS

	Radiation: Type (A)	Radiation: Exposure (B)	Latent Period (C)	Late Effects (D)	Reference (E)
	Rat				
185	X ray	≥2,000 r (locally to teeth)		Retardation of eruption of incisors.	3,75, 76
186		4,000 r (locally to teeth)		Stoppage of growth of dentin (lengthwise) in incisors.	
187		500 r to whole body		5 months required for complete restoration of epithelium in testes (Vanderbilt's strain, adult males).	66
188	X ray (250 kv)	25-400 r to whole body (40 da old)	10.5-11 mo	Incidence of mammary gland neoplasia linear with doses between 25 and 400 r; above 400 r, incidence is either decreased or remains constant.	9
189		120-480 r to whole body (1-6 exposures, 3 mo old)	Death	Mean longevity: controls, 28.6 mo; 120 r, 24.9 mo; 240 r, 23.1 mo; 480 r, 20.2 mo.	39
190		400 r to whole body (either castrated or intact male, 40 da old)	16 mo[4]	50% incidence of breast neoplasms (more fibrosarcomas); total incidence lower than in irradiated females.	67
191		400 r (female 40 da old)	At end of 10 mo	79% tumor incidence, with one or more breast neoplasms.	19
192		773±88 r to abdomen only	420 da	50% mortality.	21
193		943±60 r to head only	168 da		
194		1,062±12 r to thorax only	90 da		
195		1,000 r (under 5% oxygen pressure) to whole body	Up to 500 da	Shortening of life span, nephrosclerosis, generalized arteriosclerosis, hypertension, thrombocytopenia, anemia, increased susceptibility to oral hypertonic sodium chloride, earlier appearance of neoplasms.	6,34-38
196	Yttrium-91	2.0 μc/g	1-3 mo	Damage to epiphyseal cartilage, production of atypical bone; increase in spleen hematopoiesis.	8
197		20-30 mc/kg (1 dose orally), or 1-2 mc/kg/da, 6 da/wk for 3 mo	200-400 da	A variety of intestinal lesions with obstruction. Yttrium essentially not absorbed from intestinal tract.	42
	Rabbit				
198	Neutrons	0.012-0.11 n/da, 6 doses/wk	1 yr	No observed effects.	7
199		1.7 n/da	1 yr	Increased incidence of infection; hypoplasia of bone marrow; atrophy of testes; reduction of lymphocytes; neutrophils depressed after 8 wk, erythrocytes after 32-35 wk.	
200		3.7 n/wk (52.7-83.7 n, total)	4-12 mo	No lens changes.	53
201		33-100 n (single doses)	2-5 mo	Cataracts of posterior lens.	
202	Fission	3×10^{10} particles/ml	125 da	Cataracts (2×10^{9} particles/ml, or less, is threshold for lens opacities).	14
203	14 Mev	8×10^{10} particles/ml	125 da		
204	Phosphorus-32 (external)	2,500-3,000 rep	2 mo	Graying of fur.	78
205		5,000 rep		Epilation; recovery by 10 wk.	
206		7,500 rep		Permanent epilation, ulcerations.	
207		15,000 rep		Emaciation.	
208	Radium	100 μg in 90 da ($RaSO_4$ in glycerine, orally)	2 mo	Mottling and shortening of incisors.	28,64
209			5-18 mo	Pathological fractures, alopecia.	
210			9 mo	Jaw abscesses; rarefaction of mandible and other bones (generalized osteoporosis and necrosis); weight loss; mild, progressive, regenerative anemia, with hyperplasia and fibrosis of marrow, lymph nodes, spleen.	
211	Strontium-90	100 μc/kg (iv)	90 da	% of controls: total body wt, 92%; wt of femur, 81%; wt of tibia, 91%; length of tibia, 98%.	46
212		600 μc/kg (iv)	90 da	% of controls: total body wt, 34%; wt of femur, 71%; wt of tibia, 70%; length of tibia, 69%.	
213	Thorium dioxide (α and γ rays)	Intravenous injection		Osteosarcoma; hematopoietic depression and damage to liver and spleen. Deposited in reticuloendothelial system.	59

/4/ Longer interval than for irradiated females.

XII. PARASITISM

128. ARTHROPOD PARASITES: MAMMALS AND BIRDS

Many of the arthropods listed are known to be parasites of man. Some of these are identified by an asterisk (*).

	Species (Common Name); Distribution	Free Stage Location	Host [Location and Stage in Host]	Effect on Host	Reference
	(A)	(B)	(C)	(D)	(E)
			Pentastomida		
1	*Linguatula serrata* (tongue worm); worldwide	Eggs swallowed, hatched in alimentary tract of herbivores; larvae, nymphs develop in mesenteries	Mammals, birds, [Eggs expelled in respiratory tract; adults in nasal passages]	Severe irritation and blockage of nasal passages.	11
			Arachnida		
2	*Amblyomma americanum** (lone-star tick); N., Cen., & S. America	Eggs in soil; unfed larvae, nymphs, adults on grass	Cattle, dog, horse, goat, sheep, occasionally birds. [External--on host only while feeding]	Damage to hide, milk reduction. Vector of organisms causing Rocky Mt. spotted fever, Q fever. Larvae, nymphs, adults are bloodsuckers.	1,13
3	*Argas persicus* (fowl tick); warm & temperate semi-arid regions of world	All stages in crevices, cracks of housing, under bark of trees	Domestic fowl, occasionally wild birds. [External--on host only while feeding]	Anemia, leg weakness, egg reduction, occasionally death. Vector of organisms causing fowl spirochetosis, spiroplasmosis. Nymphs, adults are bloodsuckers.	1,3,13
4	*Bdellonyssus sylviarum* (northern fowl mite); United States, Canada, Mexico, Europe, S. Africa	Eggs on feathers, in nests; other stages on surroundings	Poultry, wild birds. [External; on body and feathers]	Skin lesions, egg reduction, retarded growth, anemia. Harborer of neurotropic viruses. Larvae, nymphs, adults are bloodsuckers.	1,3
5	*Boophilus annulatus** (cattle tick); N. America	Eggs on soil; unfed larvae on grass	Principally ungulates. [External]	Damage to hide, milk reduction. Vector of organisms causing Texas cattle fever. Larvae, nymphs, adults are bloodsuckers.	1,2, 11, 13
6	*Demodex canis* (dog follicle mite); worldwide	None	Dog. [Eggs, nymphs, adults in hair follicles and sebaceous glands]	Follicle inflammation, mange, thickened skin, alopecia, emaciation; sometimes death.	1,11
7	*Dermacentor andersoni** (Rocky Mountain wood tick); Western N. America	Eggs on soil	Most mammals. [External; larvae, nymphs on most small animals; adults usually on larger animals during feeding period]	Paralysis, particularly in sheep. Vector of organisms causing Rocky Mt. spotted fever, tularemia, equine encephalomyelitis, anaplasmosis. Larvae, nymphs, adults are bloodsuckers.	11,13
8	*D. variabilis* (American dog tick); N. America	Eggs on soil; unfed larvae, nymphs, adults on vegetation until host is found	Principally dog; other domestic and wild animals. [External--on host only while feeding; larvae, nymphs mainly attack rodents and other small animals]	Skin damage. Vector of organisms causing bovine anaplasmosis, tularemia, Rocky Mt. spotted fever. Larvae, nymphs, adults are bloodsuckers.	1,13
9	*Dermanyssus gallinae* (chicken mite); worldwide	Eggs, non-feeding larvae, nymphs, adults in crevices of coops, roosts	Poultry, other birds. [External]	Decreased egg production, retarded growth, anemia; sometimes death. Vector of organisms causing spirochetosis, fowl cholera. Larvae, nymphs, adults are bloodsuckers; nocturnal feeders only.	1,3
10	*Eutrombicula alfreddugesi* (chigger); N. & S. America, W. Indies	Active forms in grasses, shrubs, brambles	Domestic and wild vertebrates. [External]	Irritation due to toxins; sometimes death (small poultry). Larvae are bloodsuckers.	1,11, 13

continued

128. ARTHROPOD PARASITES: MAMMALS AND BIRDS

	Species (Common Name); Distribution	Free Stage Location	Host [Location and Stage in Host]	Effect on Host	Reference
	(A)	(B)	(C)	(D)	(E)
	Arachnida				
11	*Ixodes ricinus scapularis* (black-legged tick); principally Europe	Eggs on soil; larvae, nymphs, adults on grass and shrubbery until host is found	Principally dog; other domestic and wild animals. [External--on host only while feeding; adults on head, neck of dog; on flank, leg, under tail of other animals]	Anemia. Vector of cattle redwater fever, louping ill virus, tick-borne fever virus of sheep. Larvae, nymphs are bloodsuckers in ear, eyelid, head, rarely body.	1,11
12	*Knemidokoptes mutans* (scaly-leg mite); worldwide	None	Chicken, turkey, other domestic birds. [External; all active stages in tunnels between scales, feet, legs, neck, comb]	Inflammation, keratinization between scales of feet, legs; lameness.	1,3,11
13	*Otobius megnini** (ear tick); United States, Mexico, S. America, S. Africa	Eggs on ground, in cracks; adults, unattached larvae in outbuildings	Domestic animals. [Inside ears]	Ear inflammation, anorexia, dullness; sometimes death. Larvae, nymphs are bloodsuckers.	1,11, 13
14	*Otodectes cyanotis* (ear mite); worldwide	None	Dog, cat, ferret. [All stages in ears; sometimes external]	Inflammation, ear scabs, head-shaking, scratching, droopy ears with discharge; epileptiform fits (severe cases).	1,11
15	*Psoroptes equi ovis*[1] (sheep-scab mite); worldwide	None	Sheep. [External; all active stages on skin around edge of lesions]	Scabbing; wool loss from biting, scratching; emaciation; sometimes death.	1,11, 13
16	*Rhipicephalus sanguineus** (brown dog tick); worldwide	Active forms near habitat of dog	Principally dog. [External]	Vector of organisms causing canine piroplasmosis, cattle gall sickness. Larvae, nymphs, adults are bloodsuckers.	1,11
17	*Sarcoptes scabiei** (itch mite); worldwide	None	Most mammals, sheep (on head). [External; all active stages in skin tunnels]	Scratching, papules, vesicles, keratinization, alopecia, mange, emaciation; sometimes death.	1,11, 13
	Insecta				
18	*Aedes dorsalis** (mosquito); N. America, Europe, northern Africa	Immature forms in moist soil; eggs survive long periods of drying in soil	Warm-blooded animals. [External]	Adult females are bloodsuckers. Vectors of organisms causing equine encephalomyelitis.	9,11
19	*Anopheles punctipennis** (mosquito); N. America	Immature forms in streams, ponds of hilly country	Warm-blooded animals. [External; where hair or feathers are thinnest]	Adult females are bloodsuckers. Vectors of organisms causing dog heartworm.	9
20	*Bovicola bovis* (cattle-biting louse); N. & S. America, Europe, Africa, Australia	None	Cattle. [External; eggs on hair; nymphs, adults feed on skin]	Reduced vigor, irritation, scaly skin.	11,13
21	*Cimex lectularius** (bedbug); worldwide	All stages in cracks, crevices, similar hiding places	Domestic animals, poultry. [External]	Skin irritation, welts. Nymphs, adults are bloodsuckers.	11,13
22	*Chrysops discalis* (deerfly); Western N. America	Eggs near water, larvae in water, pupae in mud	Principally horse, cattle. [External; mainly on underside of abdomen, neck, withers]	Vector of tularemia, surra. Adults are bloodsuckers.	5,11
23	*Cochliomyia hominivorax**[2] (screwworm); tropical & subtropical areas of western hemisphere	Pupae in soil, adults in pastures	Obligatory parasite of warm-blooded animals, including livestock, wild mammals, dog, cat. [Eggs deposited on edges of wounds]	Infection and extension of wounds; untreated host invariably dies.	4,8,10

/1/ Other varieties infest various domestic animals. /2/ Adult stage of *C. macellaria* (secondary screwworm) resembles *C. hominivorax* in appearance, but differs by being a secondary invader (facultative parasite), and by breeding in carcasses. Larvae occasionally infest wool or necrotic wounds.

continued

128. ARTHROPOD PARASITES: MAMMALS AND BIRDS

	Species (Common Name); Distribution	Free Stage Location	Host [Location and Stage in Host]	Effect on Host	Reference
	(A)	(B)	(C)	(D)	(E)
	Insecta				
24	*Ctenocephalides canis* (dog flea); worldwide	Immature forms associated with nest or sleeping area of host; adults on ground part of time	Cat, dog, swine, other animals. [External]	Coat damaged from biting, scratching. *C. canis* and *C. felis* are vectors of dog and dwarf tapeworms, heartworm, plague, epidemic typhus. Adults are bloodsuckers.	6,11, 17
25	*C. felis** (cat flea); worldwide				
26	*Cuclotogaster heterographus* (chicken head louse); worldwide	None	Chicken, partridge. [External; nymphs, adults on skin and feathers of head, neck; eggs on feathers]	Irritation.	3,11
27	*Culex quinquefasciatus** (southern house mosquito); worldwide from 60°N to 50°S latitude	Immature forms in stagnant water, ponds, ditches	Warm-blooded animals, especially birds. [External; where hair or feathers are thinnest]	Adult females are bloodsuckers. Vectors of organisms causing avian malaria, fowl pox.	3,9,11
28	*Dermatobia hominis** (human botfly); S. America, W. Indies, tropical N. America	Eggs glued to other arthropods; hatch when suitable host is reached	Dog, swine, mule, cattle, wild animals. [Larvae leave transport arthropod on contact with host; penetrate skin]	Boil-like skin lesions, reduced milk production, damage to hide, decreased growth rate.	8,10, 14
29	*Echidnophaga gallinacea** (sticktight flea); worldwide, especially warm climates	Immature forms associated with nest or sleeping area of host	Poultry, domestic animals, rodents. [External; skin, comb, wattles; around eyes and ears]	Anemia; sometimes death. Adults are bloodsuckers.	3,13, 16
30	*Gasterophilus intestinalis*[3] (horse botfly); worldwide	Pupae in soil; adults attack animals only in daytime	Ass, horse, mule; rarely other animals. [Eggs on foreleg fetlock hairs; larvae (maggots) in mouth, pharynx, stomach]	Extension and infection of wounds.	8,10, 14
31	*Glossina morsitans** (tsetse fly); central Africa	Larvae pass from female when ready to pupate in soil	Cattle, other animals. [External]	Vector of organisms causing cattle and horse nangana, sleeping sickness to man. Adults are bloodsuckers.	11,17
32	*Haematopinus eurysternus*[4] (short-nosed cattle louse); worldwide	None	Cattle. [External; eggs on shaft or at base of hairs]	Hair damage from rubbing; stunting; reduced milk production. Nymphs, adults are bloodsuckers.	11,13
33	*H. suis* (hog louse); worldwide	None	Swine. [External; eggs on hair]	Dermatitis, skin sores, retarded growth. Vector of organism causing swine pox. Nymphs, adults are bloodsuckers.	13
34	*Hypoderma lineatum*[5] (common cattle grub); prevalent in America, Europe, India, northern Asia	Pupae in soil, adults in pastures	Cattle, rarely horse. [Eggs on hair of legs, body; larger larvae form tumor under skin of back]	Skin perforation, hide and flesh damage, milk reduction.	4,11, 13
35	*Melophagus ovinus* (sheep ked); most parts of world	Larvae retained in female until mature; pupae on wool	Sheep, occasionally goat. [External; pupae attached to wool]	Anemia; wool stained, damaged from rubbing. Adults are bloodsuckers.	11,13, 17
36	*Menacanthus stramineus* (chicken body louse); worldwide	None	All domestic fowl. [External; nymphs, adults on skin around vent; eggs attached to feathers]	Scabbing of skin; wasting; reduced egg production.	3,11
37	*Menopon gallinae* (shaft louse); worldwide	None	Chicken, guinea fowl. [External; eggs, nymphs, adults feed on scales, scabs, feathers]	Scaling, scabbing.	3,11

/3/ *G. haemorrhoidalis* (nose botfly) and *G. nasalis* (throat botfly) are similar in many respects to *G. intestinalis*. /4/ Information also applicable to *Linognathus vituli* (long-nosed cattle louse). /5/ Information also applicable to *H. bovis* (northern cattle grub).

continued

	Species (Common Name); Distribution	Free Stage Location	Host [Location and Stage in Host]	Effect on Host	Reference
	(A)	(B)	(C)	(D)	(E)
			Insecta		
38	*Musca domestica* (housefly); worldwide	Immature forms in manure and decayed matter, adults in buildings	Any larger animal with lesions or secretions. [External; adults accidentally ingested by host]	Adults cause decreased productivity of livestock. Vector of several tapeworm species; mechanical vector of many bacterial and protozoan pathogens and helminth eggs.	3,11, 13
39	*Oestrus ovis* (sheep botfly); worldwide	Pupae on ground, adults in warm corners, crevices	Sheep, rarely goat. [Larvae in nasal cavities, sinuses]	Mucosal irritation, nasal discharge, emaciation; sometimes death.	8,11, 13
40	*Phaenicia sericata* (greenbottle fly); worldwide, except S. America and Pacific Islands	Adults free-living, deposit eggs on flesh, soiled wool; pupae in soil	Sheep, goat, other animals. [Larvae on skin, in wounds]	Invasion of wounds, suppuration.	7,11
41	*Phlebotomus papatasii** (sand fly); Mediterranean region, southern Europe, Asia	Immature forms in dark moist places, manure	Warm-blooded animals. [External]	Swelling at site of bite. Vector of organisms causing pappataci fever. Adults are nocturnal bloodsuckers.	11,13, 16
42	*Phormia regina*[6] (black blowfly); worldwide	Pupae in soil, adults in pastures	Sheep, other mammals. [Eggs in hair or wool, larvae in wounds; eggs and larvae also in carcasses]	Extension and infection of wounds.	7,13
43	*Pulex irritans** (human flea); worldwide	Eggs, larvae, and pupae in soil, adults on ground part of time	Man, dog, swine, other animals. [External]	Irritation, poor condition, coat damaged from biting and scratching. Adults are bloodsuckers.	11,17
44	*Simulium* spp.[7] (blackfly); worldwide in temperate to subarctic climates	Immature forms on under sides of stones in moderate-running streams	All warm-blooded animals. [External; on bare parts of head, body, legs; under wings]	Red swelling, vesicles, anemia, toxemia; death. *S. occidentale* and *S. slossonae* are vectors of turkey leucocytozoan disease; some species are vectors of onchocerciasis to man and cattle. Adults are bloodsuckers.	3,11, 13, 16
45	*Siphona irritans* (horn fly); America, Europe	Eggs, maggots in fresh dung, pupae in dung or soil	Cattle, other animals. [External]	Weight loss; milk reduction. Adults are bloodsuckers.	11,13, 17
46	*Stomoxys calcitrans** (stable fly); worldwide	Immature forms in manure and other moist organic waste	Most mammals and birds. [External]	Weight loss; milk reduction. Vector of poultry tapeworms, filariae, spiruroids; mechanical vector of surra. Adults are bloodsuckers.	3,7,11
47	*Tabanus atratus* (black horsefly); N. America	Immature forms in leaves and mud in and near streams, ponds	Most warm-blooded animals. [External]	Vector of organism causing anaplasmosis. Adults are bloodsuckers during day.	13,15
48	*Triatoma sanguisuga*[8] (cone-nose bug); worldwide	All stages commonly found in or close to rodent nests or habitats	All domestic animals, poultry; wood rat usual host. [External]	Swelling, anemia. Nymphs, adults are bloodsuckers.	12,13, 17
49	*Trichodectes canis* (dog-biting louse); worldwide	None	Dog. [External; eggs on hair; nymphs and adults feed on skin]	Scaly skin from rubbing, scratching.	11
50	*Wohlfahrtia vigil** (flesh fly); N. America	Pupae on ground, larvae in woods	Rabbit, mink, guinea pig, young of domestic and wild animals. [Larvae in wounds]	Mild to extensive subcutaneous pustular lesions; occasionally death.	7,11

/6/ *Chrysomya chloropyga* is similar to *P. regina* in its parasitism of sheep. /7/ *S. articum*, *S. occidentale*, *S. ornatum*, *S. vittatum* are the important blackfly pests of livestock. /8/ Sixteen species of *Triatoma* found in the western hemisphere are as important and as widely distributed as *T. sanguisuga*.

129. ARTHROPOD PESTS: PLANTS AND PLANT PRODUCTS

	Species	Common Name	Stage[1]	General Distribution	Host	Destructive Activity
	(A)	(B)	(C)	(D)	(E)	(F)
				Arachnida		
1	*Eriophyes pyri*	Pear leaf blister mite	Adult; immature	All pear-growing regions	Pear, apple	Sucking causes blisters on underside of leaves
2	*Rhizoglyphus echinopus*	Bulb mite	Adult; immature	N. America, Europe, Asia	Ornamental bulbs, onion	Bores into bulbs
3	*Steneotarsonemus pallidus*	Cyclamen mite	Adult; immature	N. America, Europe	Greenhouse ornamentals, strawberry	Sucks plant juices, distorts buds and leaves
4	*Tetranychus telarius*	Two-spotted spider mite	Adult; immature	United States, Europe, Africa, Asia, Australia	Cultivated plants	Sucks plant juices, causing loss of vigor, dropping of leaves
				Crustacea		
5	*Porcellio laevis*	Sowbug	Adult; immature	Worldwide	Vegetables, ornamentals	Chews roots, growths near ground
				Insecta		
6	*Acanthoscelides obtectus*	Bean weevil	Larva	Worldwide	Bean, pea, cowpea	Devours inside of bean in field and in storage
7	*Agriotes, Horistonotus, Limonius, Melanotus* spp.	Wireworms	Larva	Worldwide	Truck, cereal, and forage crops	Devours or bores into roots, seeds
8	*Alabama argillacea*	Cotton leafworm	Larva	N. & S. America	Cotton only	Devours leaves
9	*Altica, Phyllotreta* spp.	Flea beetles	Adult; larva[2]	Worldwide	Vegetable crops	Adult makes holes in leaves, larva often feeds on roots
10	*Amphibolips confluenta*	Oak gall wasp	Larva	Worldwide	Oak	Causes galls on oak leaves
11	*Anabrus simplex*	Mormon cricket	Adult; nymph	Western United States	Hay, grain, many plants	Devours hay, grain, leaves of plants
12	*Anasa tristis*	Squash bug	Adult; nymph	N. & Cen. America	Squash, other cucurbits	Sap sucking causes plants to wilt and die

/1/ Destructive stage of arthropod. /2/ Overwinters as adult.

continued

129. ARTHROPOD PESTS: PLANTS AND PLANT PRODUCTS

	Species	Common Name	Stage[1]	General Distribution	Host	Destructive Activity
	(A)	(B)	(C)	(D)	(E)	(F)
				Insecta		
13	*Anthonomus grandis*	Boll weevil	Adult; larva	Southern United States, Mexico	Cotton	Destroys buds, devours squares and bolls
14	*Aphis pomi*	Apple aphid	Adult; nymph	N. America	Apple	Causes wilting
15	*Aspidiotus perniciosis*	San Jose scale	Adult; nymph	Worldwide	Deciduous fruit trees, ornamentals	Secreted toxins cause wilting, kill infested trees
16	*Blissus leucopterus*	Chinch bug	Adult; nymph	N. America	Corn, grains, grasses	Sap sucking causes wilting, death
17	*Carpocapsa pomonella*	Codling moth	Larva	Apple-growing regions of N. & S. America, Europe, Asia, S. Africa, southern Australia	Apple, pear, quince, walnut, apricot, similar fruits	Bores into and destroys fruit, or reduces its value
18	*Cephus pygmaeus*	European wheat stem sawfly	Larva	Northeastern United States, Europe, Near East	Wheat, rye, barley, timothy, other grasses	Mines stems, causing breakage
19	*Ceratitis capitata*	Mediterranean fruit fly	Adult; larva	Mediterranean region, Hawaii, S. Africa, S. America, western Australia	Fruits, vegetables	Adult makes egg punctures, larva burrows through fruit
20	*Choristoneura fumiferana*	Spruce budworm	Larva	Northern United States, Canada	Fir, spruce, hemlock, larch, white pine	Causes partial-to-complete defoliation
21	*Chrysobothris femorata*	Flatheaded apple tree borer	Larva	United States, Canadian fruit-growing areas	Fruit trees, many shade trees	Bores into trunk of weakened trees, branches, twigs; kills tree
22	*Cladius isomerus*	Rose slug	Larva	Worldwide	Rosebush	Skeletonizes and causes browning of leaves
23	*Coccus hesperidum*	Brown scale	Adult; nymph	Worldwide in greenhouses (subtropical spp.)	Citrus, ornamentals	Sap sucking causes plants to die back[3]
24	*Conotrachelus nenuphar*	Plum circulio	Adult; larva	Eastern United States, Canada	Plum, apple, peach, cherry, deciduous stone fruits	Adult punctures fruit, larva feeds within and destroys fruit
25	*Corythuca arcuata*	Oak lace bug		Worldwide	Various trees, shrubs	Speckling of leaves, stunting
26	*Dendroctonus monticolae*	Mountain pine beetle	Adult; larva	Western United States	Western, lodgepole, sugar, ponderosa, white bark, and limber pines	Bores into bark and cambial region; may girdle and kill tree
27	*Diabrotica undecimpunctata*	Spotted cucumber beetle	Adult; larva	N. America	Corn, cucurbits, weeds, grasses, other plants	Larva feeds on roots, adult devours foliage[4]
28	*Diprion hercyniae*	European spruce sawfly	Larva	Europe, northeastern United States, Canada	Spruce	Devours leaves
29	*Drosophila melanogaster*	Fruit fly	Larva	Worldwide	Ripe or decaying fruit	Breeds in ripe fruit
30	*Empoasca fabae*	Potato leafhopper	Adult; nymph	N. & S. America	Potato, alfalfa, bean, celery, other plants	Leaf sucking[5] causes wilting, drying of leaves, stunting
31	*Ephestia kuehniella*	Mediterranean flour moth	Larva	Worldwide	Mill products	Destroys grain products
32	*Epicauta vittata*	Blister beetle	Adult	Worldwide	Potato, legumes	Devours plants

/1/ Destructive stage of arthropod. /3/ Honeydew is formed or excreted. /4/ Also vector of bacterial wilt of cucurbits, and of viral yellow disease of asters. /5/ Also transmits hopperburn disease.

continued

	Species	Common Name	Stage[1]	General Distribution	Host	Destructive Activity
	(A)	(B)	(C)	(D)	(E)	(F)
				Insecta		
33	*Epilachna varivestis*	Mexican bean beetle	Adult; larva	United States, Mexico	Bean, soybean, cowpea, other legumes	Devours leaves, pods, stems
34	*Epitrix hirtipennis*	Tobacco flea beetle	Adult	Worldwide	Tobacco	Devours leaves, especially those of young plants
35	*Eriosoma lanigerum*	Woolly apple aphid	Adult; nymph	N. & S. America, Europe, S. Africa, Asia, Australia	Apple, pear, elm	Branch and root sucking causes deformed twigs, knotty roots, stunting
36	*Forficula auricularia*	European earwig		Worldwide	Growing plants, stored grain, decayed vegetation	Chewing
37	*Gryllus* spp.	Field cricket	Adult; nymph	N., Cen., & S. America	Hay crops, cotton, linen	Devours hay, plants, cotton, linen
38	*Harmolita tritici*	Wheat jointworm	Larva	Eastern & central United States	Wheat, some grasses	Causes gall in wheat, breaking of stems
39	*Heliothis zea*	Corn earworm	Larva	Worldwide	Cotton, corn, tomato, alfalfa, other plants	Bores into and feeds on bolls, ears, buds; stunts plants, reduces yield
40	*Hylemya antiqua*	Onion maggot	Larva	Europe, N. America	Onion, garlic	Mines out bulbs[3]
41	*Hyphantria cunea*	Fall webworm	Larva	United States, southern Canada	Broadleaf fruit, shade and nut trees	Webs branches, devours foliage
42	*Lampetia equestris*	Narcissus bulb fly	Larva	Europe, N. America	Narcissus, other bulbs	Bores into bulbs
43	*Lasius alienus americanus*	Cornfield ant	Adult	United States	Corn	Symbiotic, with aphids attacking corn roots
44	*Lepisma saccharina*	Silverfish	Adult; nymph	Worldwide	Starchy substances	Devours bookbindings, fabrics, wallpaper
45	*Leptinotarsa decemlineata*	Colorado potato beetle	Adult; larva	N. America, Europe	Potato, tomato, tobacco, eggplant, other solanaceous plants	Devours leaves, terminates growth
46	*Liposcelis divinatorius*	Book louse	Adult; immature	Worldwide	Cereals, vegetables	Contaminates food, destroys bookbindings
47	*Lygus lineolaris*	Tarnished plant bug	Adult; nymph	N. America	Many plants, trees	Leaf sucking and toxins cause bud drop, distortion, stunting
48	*Magicicada septendecim*	Periodical cicada	Adult	Eastern & southern United States	Many deciduous trees, shrubs	Oviposition punctures injure or kill twigs
49	*Malacosoma disstria*	Forest tent caterpillar	Larva	N. America	Aspen, sugar maple, oak, birch, basswood, ash, gum, other trees	Defoliates trees in summer
50	*Megachile latimanus*	Leaf-cutting bee	Adult	Worldwide	Various trees	Cuts off leaf fragments for nests
51	*Melanoplus femurrubrum*	Red-legged grasshopper	Adult; nymph	Worldwide	Hay crops (range and pasture)	Devours hay, grasses, vegetation
52	*Microcentrum rhombifolium*	Broad-winged katydid	Adult; nymph	N. America	Many broad-leaved trees, shrubs	Chews leaves
53	*Murgantia histrionica*	Harlequin cabbage bug	Adult; nymph	Southern United States, Mexico, Cen. America	Cabbage, related crops, other plants	Sap sucking causes plants to wilt, brown, and die
54	*Myzus persicae*	Green peach aphid	Adult; nymph	Warm regions of world	Many trees, shrubs	Leaf sucking causes curling, distortion of leaves[3]

/1/ Destructive stage of arthropod. /3/ Honeydew is formed or excreted.

				Insecta		
55	*Oryzaephilus surinamensis*	Saw-toothed grain beetle	Adult; larva	Worldwide	Grain, grain products, dried fruit	Infests and devours grain, grain products, dried fruit
56	*Oscinella frit*	Frit fly	Larva	N. America, Europe, Asia	Cereals, grasses	Bores into stems, eats central shoots
57	*Paleacrita vernata*	Spring cankerworm	Larva	Eastern United States, Canada	Fruit and shade trees	Defoliates trees in spring
58	*Pectinophora gossypiella*	Pink bollworm	Larva	Southern United States, S. America, Africa, Europe, Asia, Australia	Cotton, okra, other malvaceous plants	Bores into and feeds on squares and bolls, cutting fiber, reducing yield
59	*Peridroma saucia*	Variegated cutworm	Larva	Worldwide	Many plants	Cuts down seedlings, transplants
60	*Philaenus leucophthalmus*	Meadow spittlebug	Nymph	Eastern United States	Legumes, hay crops	Sap sucking causes wilting, stunting, reduced forage yield
61	*Phyllophaga* spp.[6]	June beetle	Adult; larva	N. America	Most plants	Adult defoliates trees; larva devours roots, underground parts
62	*Phylloxera vitifoliae*	Grape phylloxera	Adult; nymph	N. America, Europe	Grape vines	Root and leaf sucking causes galls, eventual death of vines
63	*Phytophaga destructor*	Hessian fly	Larva	Europe, Asia, N. America, New Zealand	Wheat, barley, rye	Feeds on stems, causing breaking and stunting
64	*Pieris rapae*	Imported cabbageworm	Larva	N. America, Asia, Australia, Europe	Cabbage, other crucifers	Devours foliage
65	*Plodia interpunctella*	Indian meal moth	Larva	Worldwide	Grain, grain products, dried fruit, nuts	Destroys and webs grain, grain products; infests fruit, nuts
66	*Plutella maculipennis*	Diamondback moth	Larva	Worldwide	All cruciferous plants	Eats small holes in outer leaves
67	*Popillia japonica*	Japanese beetle	Adult; larva	Eastern United States, Japan, China	Fruit trees, ornamentals, vegetables, grasses	Destroys turf, foliage, blossoms, fruit
68	*Porthetria dispar*	Gypsy moth	Larva	Northeastern United States, Europe, Asia	Most deciduous and evergreen trees, shrubs	Devours leaves
69	*Protoparce quinquemaculata*	Tomato hornworm	Larva	N. & S. America, Europe, Hawaii	Tomato, tobacco, other solanaceous plants	Devours foliage
70	*Pseudaletia unipuncta*	Armyworm	Larva	Worldwide	Grains, grasses, some legumes	Devours foliage
71	*Pseudococcus citri*	Mealybug	Adult; nymph	Tropical & subtropical areas	Citrus, ornamental plants	Sap sucking causes plants to die back[3]
72	*Psila rosae*	Carrot rust fly	Larva	Europe, northern N. America	Carrot, celery, umbelliferous plants	Bores into and eats fibrous roots
73	*Psyllia pyricola*	Pear psylla	Adult; nymph	Europe, United States	Pear	Leaf sucking causes leaf drop[3]
74	*Pyrausta nubilalis*	European corn borer	Larva	Eastern United States, Europe, Asia	Corn is main host; also many vegetables, weeds, ornamentals	Bores into stalks and ears, causing breakage, reduced yield and quality
75	*Ramosia tipuliformis*	Currant borer	Larva	N. America, Asia, Europe, Australia	Currant, gooseberry, black elder, sumac	Burrows through canes
76	*Reticulitermes flavipes*	Eastern subterranean termite	Adult; nymph	Eastern United States	Wood, dead wood, cellulose products	Riddles, weakens, destroys wood and cellulose materials

/1/ Destructive stage of arthropod. /3/ Honeydew is formed or excreted. /6/ Other important June beetles belong to *Melolontha* and *Polyphylla* spp.

	(A)	(B)	(C)	(D)	(E)	(F)
				Insecta		
77	*Rhagoletis pomonella*	Apple maggot	Larva	Northeastern & north central United States	Apple, blueberry	Bores into and destroys fruit
78	*Sanninoidea exitiosa*	Peach tree borer	Larva	All peach-growing areas	Peach, other stone-fruit trees	Bores into trunk at ground-level roots, girdles tree trunk, kills tree
79	*Saperda candida*	Round-headed apple tree borer	Larva	Eastern United States, Canada	Apple, pear, quince trees	Bores into trunk
80	*Schistocerca gregaria*[7]	Desert locust	Adult; nymph	India, Iran, Arabia, N. Africa	Many plants	Chews leaves
81	*Sitophilus oryza*	Rice weevil	Adult; larva	Worldwide	Stored grains, cereal products	Larva grows in kernels, destroys stored grain
82	*Sminthurus viridis*	Lucerne flea	Adult; immature	Europe, Australia	Legumes	Surface feeding causes scorching of leaves
83	*Spissistilus festinus*	Three-cornered alfalfa bug	Adult	Worldwide	Alfalfa	Stunting
84	*Tenebrio molitor*	Yellow mealworm	Larva	Worldwide	Grain products, refuse	Destroys grain, grain products
85	*Tenebroides mauritanicus*	Cadelle	Adult; larva	Worldwide	Stored grain, grain products	Infests and destroys grain, grain products
86	*Thermobia domestica*	Firebrat	Adult; nymph	Worldwide	Starchy substances	Devours bookbindings, fabrics, wallpaper
87	*Thrips tabaci*	Onion thrips	Adult; larva; nymph	N. & S. America, Europe, Asia, S. Africa, Australia	Onion, bean, cabbage, tomato, cotton	Sap sucking causes leaves and buds to pucker and silver
88	*Thyridopteryx ephemeraeformis*	Bagworm	Larva	Eastern United States	Cedar, other trees	Devours foliage
89	*Trialeurodes vaporariorum*	Greenhouse whitefly	Nymph	Worldwide	Most plants	Leaf sucking causes wilting[3]
90	*Tribolium confusum*	Confused flour beetle	Adult; larva	Worldwide	Flour, grain products	Infests and contaminates flour, mixes, bread
				Symphyla		
91	*Scutigerella immaculata*	Garden symphylid	Adult; immature	N. & S. America, Europe, Africa	Garden plants, flowers	Chews tender plants, rootlets
				Diplopoda		
92	*Julus heserus*	Millipede	Adult; immature	Worldwide	Vegetables, ornamentals	Chews young roots, stems

/1/ Destructive stage of arthropod. /3/ Honeydew is formed or excreted. /7/ Has a migratory phase.

1	*Ancylostoma braziliense* (hookworm)	Limited distribution in warm climates	Cat, dog	None	Filariform larva
2	*A. duodenale* (hookworm)	Tropical & subtropical Africa, Asia, Europe, United States; western S. America	None	None	Filariform larva
3	*Ascaris lumbricoides* (large roundworm)	Worldwide; more common in warm climates	Swine ?	None	Fully embryonated egg
4	*Brugia malayi* (Malayan filarial worm)	Warm climates in Asia	Cat, monkey	Mosquito (*Armigeres, Mansonia*)	Filariform larva
5	*Dracunculus medinensis* (guinea worm)	Warm climates of eastern hemisphere	Fur-bearing mammals	*Cyclops*	3rd stage larva in *Cyclops*
6	*Enterobius vermicularis* (pinworm)	Worldwide; common in children	None	None	Fully embryonated egg
7	*Loa loa* (African filarial worm)	Tropical Africa	None	Mango fly (*Chrysops*)	Filariform larva
8	*Necator americanus* (hookworm)	Warm climates	None	None	Filariform larva
9	*Onchocerca volvulus* (convoluted filarial worm)	Tropical Africa, Mexico, Guatemala, eastern Venezuela, Dutch Guiana ?	None	Blackfly (*Simulium*)	Filariform larva
10	*Strongyloides stercoralis* (intestinal threadworm)	Warm, moist climates	Chimpanzee, dog	None	Filariform larva
11	*Trichinella spiralis* (trichina worm)	Worldwide; common in United States	Bear, swine, walrus	None	Larva encysted in pork muscle
12	*Trichuris trichiura* (human whipworm)	Warm, moist climates	Ape, monkey; swine ?	None	Fully embryonated egg
13	*Wuchereria bancrofti* (Bancroft's filarial worm)	Warm climates	None	Mosquito (*Aedes, Culex*, etc.)	Filariform larva
	Cestoda				
14	*Diphyllobothrium latum* (fish tapeworm)	North temperate & subarctic zones; lakes in Argentina, Chile	Bear, cat, dog	*Cyclops, Diaptomus*; freshwater fish	Sparganum larva in fish flesh
15	*Dipylidium caninum* (double-pored dog tapeworm)	Warm climates	Cat, dog	Cat flea, dog flea, human flea	Larva in hemocoel of dog flea
16	*Echinococcus granulosus* (hydatid tapeworm)	Worldwide; common in southern S. America	Dog, wild relatives	Cattle, sheep, swine (alternating with dog)	Eggs in dog's excreta
17	*E. multiocularis* (multiocular hydatid tapeworm)	North temperate zones	Wild canids	Small rodents	Eggs in excreta of wild canids
18	*Hymenolepis diminuta* (rat tapeworm)	Warm & temperate climates	Mouse, rat	Grain beetle, meal moth, rodent flea, etc.	Larva in hemocoel of insect
19	*H. nana* (dwarf tapeworm)	Warm & temperate climates	Mouse, rat	None; may develop in grain beetle	Egg
20	*Taenia saginata* (beef tapeworm)	Worldwide	None	Cattle	Cysticercus larva in beef
21	*T. solium* (pork tapeworm)	Worldwide	None	Swine	Cysticercus larva in pork; egg

/1/ By direct or indirect contact with body excreta containing parasite. /2/ From proboscis of insect vector at time mouth.

19	*Trichinella spiralis* (trichina worm)	Worldwide	Same individual both definitive and intermediate host[2]
20	*Trichostrongylus axei* (minute stomach worm)	Worldwide	None
21	*T. colubriformis* (hairworm)	Worldwide	None
22	*Trichuris suis* (swine whipworm)	Worldwide	None
23	*T. vulpis* (dog whipworm)	Worldwide	None
	Cestoda		
24	*Dibothriocephalus latus* (fish tapeworm)	N. America, Argentina, Chile, Europe, Australia, Manchuria, Siberia, Japan	First: copepod *(Cyclops, Diaptomus)*; second: fish
25	*Dipylidium caninum* (double-pored dog tapeworm)	Worldwide	Flea *(Ctenocephalides, Pulex)*; louse *(Trichodectes)*
26	*Echinococcus granulosus* (hydatid tapeworm)	N. & S. America, Europe, Iceland, Australia, northern Asia, Africa	Camel, cow, dog, goat, horse, monkey, moose, rabbit, sheep, rodents, etc.[1]
27	*Hymenolepis carioca* (thread tapeworm)	Worldwide	Many beetles (*Anisolarsus, Aphodius*, and others); stable fly *(Stomoxys)*
28	*Moniezia expansa* (sheep tapeworm)	Worldwide	Grass mite (*Galumna, Oribatula*, and others)

/1/ Also man. /2/ Reservoir host: swine for man.

PARASITES: MAMMALS AND BIRDS

OTHER THAN MAN

Definitive Host	Primary Location in Definitive Host	Disease or Disorder	
(D)	(E)	(F)	
	Acanthocephala		
Swine	Small intestine	Nodule formation	1
	Nematoda		
Cat, coyote, dog, fox[1]	Small intestine	Anemia, emaciation, skin reactions	2
Chicken, goose, guinea fowl, turkey, wild birds	Small intestine	Emaciation	3
Swine[1]	Small intestine	Pneumonia, abdominal discomfort and obstruction, emaciation	4
Goat, sheep, some wild ruminants	Bronchi, bronchioles	Catarrhal inflammation, coughing, emaciation	5
Cattle, deer	Bronchi, bronchioles	Catarrhal inflammation, coughing, emaciation	6
Cat, coyote, dog, fox, wolf	Heart, pulmonary artery; microfilariae in blood	Emaciation, cough, edema, dyspnea	7
Cattle, goat, sheep, other ruminants	Abomasum	Anemia, emaciation	8
Chicken, guinea fowl, pheasant, quail, turkey, other birds	Cecum	None; egg carries *Histomonas*	9
Swine	Bronchi, bronchioles	Bronchitis, pneumonia; transmits swine influenza virus	10
Antelope, goat, sheep	Large intestine; larvae in nodules throughout intestine	Diarrhea, emaciation, nodules in intestine	11
Goat, sheep	Abomasum	Anemia, emaciation	12
Cattle, sheep, rarely horse	Abomasum	Anemia, edema, emaciation	13
Horse, other equids	Small intestine	Pneumonia, digestive disturbances, emaciation	14
Cat, dog, fox[1]	Small intestine mucosa	Diarrhea	15
Horse, other equids	Large intestine	Anemia, edema, digestive disturbances, emaciation; larvae form aneurysms in anterior mesenteric arteries	16
Cat, dog, fox, wild canids and felids	Small intestine	Emaciation, poor growth	17
Coyote, dog, fox	Small intestine	Emaciation, poor growth	18
Badger, rat, swine, many other mammals[1]	Small intestine; larvae in muscles	Trichinosis, toxemia, muscle pains	19
Cattle, deer, goat, horse, sheep, swine[1]	Abomasum	Emaciation	20
Antelope, camel, cattle, goat, sheep	Small intestine	Emaciation	21
Ape, monkey, swine[1]	Cecum	Toxemia	22
Dog, fox	Cecum	Emaciation, low-grade inflammation	23
	Cestoda		
Cat, dog, fox, polar bear, other fish-eating mammals[1]	Small intestine	Toxemia, anemia	24
Cat, dog, fox, wolf, other carnivores[1]	Small intestine	Enteritis, anal pruritus	25
Dog, fox, wolf, other canids	Small intestine	Slight, if any, enteritis; hydatid cysts in liver, lungs, etc., of intermediate hosts cause serious damage	26
Chicken, quail, turkey	Small intestine	Slight damage	27
Cattle, goat, sheep, other ruminants	Small intestine	Emaciation	28

OTHER THAN MAN

Definitive Host	Primary Location in Definitive Host	Disease or Disorder	
(D)	(E)	(F)	
		Cestoda	
Chicken, pheasant, quail, turkey, wild galliforms	Small intestine	Slight damage	29
Cat, coyote, dog, fox, wolf	Small intestine	Slight, if any, enteritis; anal pruritus	30
		Trematoda	
Cat, dog, elephant, hare, horse, kangaroo, rabbit, swine, rodents; cattle, goat, sheep, other ruminants[1]	Proximal bile duct	Liver necrosis, cirrhosis, calcification of bile ducts	31
Coyote, dog, fox, lynx, mink, raccoon	Small intestine	Enteritis; parasite carries *Neorickettsia helminthoeca*, the cause of "salmon poisoning"	32
		Protozoa	
Cattle	Erythrocytes	Fever, anemia, hemoglobinuria; causes Texas fever	33
Monkey, swine[1]	Large intestine	Secondary invader of mucosa	34
Goat, sheep	Small intestine cells	Diarrhea, emaciation	35
Chicken	Small intestine cells	Hemorrhagic enteritis	36
Chicken	Cecal cells	Hemorrhagic enteritis	37
Cattle	Intestinal cells	Enteritis, hemorrhagic dysentery	38
Chicken, partridge, peafowl, pheasant, quail, ruffed grouse	Cecum, liver	Enterohepatitis, necrosis, ulceration	39
Monkey, swine[1]	Large intestine	None	40
Cat, dog, fox, mink	Small intestine cells	Diarrhea	41
Dog[1]	Reticuloendothelial system	Kala azar; reticuloendotheliosis, splenomegaly	42
Dog, gerbil[1]	Cutaneous tissues	Oriental sore, skin ulcer	43
Cattle, zebu	Lymphocytes, erythrocytes	Fever, anemia, emaciation	44
Birds; cat, dog, rodents, other mammals[1]	Endothelial cells, leucocytes	Chorioretinitis, cerebral calcification, pneumonia	45
Chicken, dove, hawk, pigeon, turkey	Crop, esophagus	Caseous nodules, necrosis	46
Cattle	Uterus, genital system, prepucial and penile membranes	Abortion, estrus irregularity, macerated fetus, contaminated semen	47
Cat, dog, swine, equids, ruminants	Blood	Anemia, emaciation, edema; causes nagana	48
Armadillo, bat, cat, dog, monkey, opossum, wood rat[1]	Blood, myocardium, and other tissues	Chagas' disease; tissue destruction	49
Cat, dog, elephant, swine, equids, ruminants	Blood	Urticaria, edema, emaciation; surra	50

birds for turkey. /5/ Reservoir host: dog for man. /6/ Reservoir hosts: dog, gerbil and *Rhombomys* for man. mals.

[2] Lapage, G., ed. 1962. Mönnig's Veterinary helminthology and entomology. Ed. 5. Williams and Wilkins. [4] Morgan, B. B., and P. A. Hawkins. 1949. Veterinary helminthology. Burgess, Minneapolis. [5] Wardle, R. A.,

Most of the nematode parasites of plants are found in close association with the roots, or in the upper 16 inches of ceous forms, also found in the soil, by the presence of a protrusile spear or stylet used to puncture and feed on plant others live only in the ocean, and many are parasites of animals and man.

	Species (Common Name)	Geographic Distribution[1]	Host[2]
	(A)	(B)	(C)
1	*Anguina* spp. (wheat gall eelworm)	N. America, Europe	Several *Agrostis* species; other grasses and cereals
2	*A. tritici* (wheat nematode)	Southern Atlantic states, Europe, southern & eastern Asia, Egypt, Australia	Emmer, rye, spelt, wheat
3	*Aphelenchoides besseyi* (summer crimp nematode of strawberry)	Southeastern United States (Maryland to Texas)	Rice, strawberry
4	*A. cocophilus* (coconut palm nematode)	West Indies, Honduras, Panama, British Guiana, Venezuela	Coconut, date, and oil palms
5	*A. fragariae* (spring crimp nematode of strawberry)	Massachusetts, Connecticut, Delaware, Maryland, Europe	Strawberry
6	*A. ritzema-bosi* (chrysanthemum nematode)	N. America, Europe	About 50 different plants, including chrysanthemum, larkspur, phlox, strawberry, verbena, zinnia
7	*Belonolaimus gracilis* (sting nematode)	Southern Atlantic states	Bean, beet, cabbage, celery, citrus, corn, cotton, cowpea, grass, millet, okra, onion, peanut, pine seedling, soybean, strawberry
8	*Criconemoides* spp. (ring nematode)	Widespread	Many plants; reported as injuring peach trees and peanut vines
9	*Ditylenchus destructor* (potato rot nematode)	Idaho, Wisconsin, Prince Edward Island, Europe	Carrot, iris, potato, sweet potato, tulip
10	*D. dipsaci* (bulb and stem nematode)	Widespread in temperate zones	Over 300 different plants, including alfalfa, clover, hyacinth, iris, narcissus, oats, onion, phlox, potato
11	*Dolichodorus heterocephalus* (awl nematode)	Florida, Georgia, North Carolina, Michigan	Bean, celery, Chinese water chestnut, corn, tomato; many other plants growing in wet locations
12	*Helicotylenchus* spp., *Rotylenchus* spp. (spiral nematode)	Widespread in sub-tropical and tropical regions	Many plants, including bean, cotton, cowpea, grass, pineapple, soybean, and ornamentals
13	*Heterodera glycine* (soybean cyst nematode)	Midwestern & southern United States, China, Japan	Adzuki bean, annual lespedeza, kidney bean, snap bean, soybean, vetch
14	*H. rostochiensis* (golden nematode of potato)	Long Island, N. Y.; Bolivia, Peru, Europe	Potato, tomato, several other solanaceous plants
15	*H. schachtii* (sugar beet nematode)	United States, Canada, Europe, Australia	Over 100 plants, including broccoli, cabbage, cauliflower, kale, mangel-wurzel, mustard, rutabaga, sugar beet, table beet, turnip
16	*Hoplolaimus tylenchiformis* (lance nematode)	N. America, Philippines, Europe	Many plants, including corn, cotton, pine tree, sugarcane, St. Augustine and other lawn grasses

/1/ Information on geographic distribution of plant parasitic nematodes is fragmentary and incomplete, even for the genus vary in ability to attack plants; some have a rather wide host range, others are highly host-specific, attacking stage of development of the host and parasite. /4/ Symptoms of nematode damage are often difficult to distinguish find the nematode in the diseased tissue or soil adjacent to the roots of affected plants.

soil formerly occupied by the roots. In general, plant nematodes can be distinguished from saprophagous or preda-
cells. The soil is not the only habitat, however, for nematodes: some live in freshwater rivers, lakes, and ponds,

Feeding Habits[3]	Symptoms[4]	Control	Reference	
(D)	(E)	(F)	(G)	
Larvae, ectoparasites around growing point; adults, endoparasites of flower primordia	Abnormal flowers developing into galls	Crop rotation; planting of gall-free seed	21,24	1
Larvae, ectoparasites around growing point; adults, endoparasites of flower primordia	Stunted plants, distorted foliage, galls instead of seed	Planting of gall-free seed (galls may be removed by salt brine flotation or mechanical separators)	18, 34	2
Vagrant ectoparasites of buds and growing point between young developing leaves	Small, crinkled, distorted foliage	Setting of new beds with uninfested plants; hot-water treatment or methyl bromide fumigation for rice seed	13,22	3
Vagrant endoparasites of roots, trunk (near periphery), leaf petioles	Disintegration of trunk tissues (causing "red ring") and of root cortex	No established control methods	40	4
Vagrant ectoparasites of buds between young developing leaves	Small, crinkled, distorted foliage	Setting of new beds with uninfested plants	5,13	5
Vagrant endoparasites of buds and foliage	Crinkled, distorted leaves and leaf spots	Hot-water treatment of dormant plants; parathion sprays	23,25,26, 46	6
Vagrant ectoparasites of root tips, sides of succulent roots, other underground parts	Devitalized root tips, root lesions, causing many short stubby branched roots, severely stunted plants	Soil fumigation	15,16,31, 39	7
Semi-sedentary ectoparasites of roots, other underground parts	Small lesions, stunting of plant	Soil fumigation	11,37	8
Vagrant endoparasites of tubers and, to some extent, of roots	Destruction of tuber tissues causing sunken areas, followed by rot	Crop rotation; planting of clean seed; soil fumigation	4,52	9
Vagrant endoparasites of bulbs, stems, leaves, occasionally roots	Twisting, wrinkling, distortion of stems and flowers; necrosis and destruction of bulb tissues	Hot-water treatment of bulbs, corms; crop rotation; field sanitation; methyl bromide fumigation of infected onion and clover seeds; planting of resistant varieties	1,20,48	10
Vagrant ectoparasites of root tips, sides of succulent roots	Devitalized root tips, small lesions on sides of roots; sometimes extensive root destruction	Soil fumigation	41,50	11
Vagrant ectoparasites, occasionally endoparasites of roots and other underground parts	Stunting of plant from retarded root growth; lesions may occur	Soil fumigation	29,47	12
Sedentary parasites of roots, internal in early stages, external as adults	General stunting of plants, reduction in size of root system; causes disease known as "yellow dwarf" in Japan and China	Crop rotation; soil fumigation; planting of resistant varieties	32,57	13
Sedentary parasites, internal in early stages, becoming largely external as adults; attack roots, other underground parts	Stunting of plant, decrease in size of root system; often increase in number of small branch rootlets	Crop rotation; soil fumigation; planting of resistant varieties	12,38	14
Sedentary parasites of roots, other underground parts; internal in early stages, external as adults	Stunting of plant, overall decrease in size of root system; often increase in number of small branch rootlets	Crop rotation; soil fumigation with dichloropropene-dichloropropane mixture before planting (sugar beet)	19,27,42, 53	15
Vagrant internal or partly external parasites of roots	Lesions leading to complete destruction and sloughing off of cortex	Soil fumigation	33	16

best known species. Undoubtedly distribution is far wider than indicated. /2/ Species of nematodes within a given
only one or two crop plants. /3/ Feeding habits and particular tissues attacked vary with the species, host plant, and
from those caused by other organisms or by poor growing conditions; hence it is important in making a diagnosis to

continued

	Species (Common Name)	Geographic Distribution[1]	Host[2]
	(A)	(B)	(C)
17	*Meloidogyne* spp. (root-knot nematode)	Worldwide; most common in warm climates	Over 2,000 plants; hosts of individual species more restricted
18	*Paratylenchus* spp. (pin nematode)	N. America, Hawaii, British Isles, Netherlands, western Africa	Many plants, including alfalfa, cabbage, celery, cowpea, cucumber, fig tree, oats, okra, pineapple, radish, wheat
19	*Pratylenchus* spp. (lesion nematode)	Worldwide	Many plants, including alfalfa, corn, cotton, small grains, strawberry, tobacco, trees and shrubs
20	*Radopholus oryzae* (rice-root nematode)	Louisiana, Texas, Indonesia, Japan, rice-growing areas of southeastern Asia	Rice, various grasses, and related monocotyledonous plants
21	*R. similis* (burrowing nematode)	Florida, Louisiana, Jamaica, West Indies, Cen. America, Peru, Brazil, Hawaii, Philippines, Formosa, Indonesia, India	About 50 different plants, including avocado, banana, black pepper, canna, citrus, coffee, rice, sugarcane, tea
22	*Trichodorus* spp. (stubby root nematode)	Widespread; important in southeastern United States, southern California, Nicaragua, Tunisia	Many plants, including beet, cabbage, cauliflower, celery, chayote, corn, cotton, fig
23	*Tylenchorhynchus* spp. (stunt nematode)	Apparently widespread	Many plants, including azalea, cotton, oats, sugarcane, tobacco, wheat
24	*Tylenchulus semipenetrans* (citrus nematode)	Florida, Texas, California, most citrus fruit-growing regions; southern Europe	Most *Citrus* and closely related genera; olive
25	*Xiphinema* spp. (dagger nematode)	Worldwide	Many plants, shrubs, trees, including clove, corn, laurel oak, oats, pecan, rose, strawberry, some grasses

/1/ Information on geographic distribution of plant parasitic nematodes is fragmentary and incomplete, even for the genus vary in ability to attack plants; some have a rather wide host range, others are highly host-specific, attacking stage of development of the host and parasite. /4/ Symptoms of nematode damage are often difficult to distinguish find the nematode in the diseased tissue or soil adjacent to the roots of affected plants. /5/ All species in the genus wood and potato tubers, respectively.

Feeding Habits[3]	Symptoms[4]	Control	Reference	
(D)	(E)	(F)	(G)	
Sedentary endoparasites of roots, other underground parts	Swellings, galls, often local necrosis of tissues; increase or reduction of branch rootlets	Annual crops: rotation and fumigation; planting of resistant varieties; hot-water treatment of bulbs, corms, tubers	9,10,28	17
Vagrant ectoparasites of roots and other underground structures	Stunting of plants from root injury and retarded root growth	Fumigation somewhat effective	35,36,54	18
Vagrant endoparasites of roots and tubers[5]	Small brown root lesions; causes "brown root rot" of tobacco	Crop rotation, tobacco; row fumigation with dichloropropene-dichloropropane mixture	45	19
Vagrant endoparasites of roots	Root lesions, destruction of cortex, root hairs; in Indonesia associated with "mentek," a rice root rot	No established control measures	2,55,56	20
Vagrant endoparasites of roots	Root lesions and disintegration	Hot-water treatment of infected citrus nursery stock; pulling of affected trees, then soil fumigation	6-8,49	21
Vagrant ectoparasites of root tips	Devitalized root tips, causing numerous short, stubby branch rootlets	No satisfactory control known	17	22
Mostly external, occasionally internal vagrant parasites of roots	Stunting of plant	Soil fumigation	30,43	23
Females are sedentary, partly external parasites of roots	Extensive necrosis, discoloration of cortex of small roots	Planting of uninfected stock on clean land	3,51	24
Vagrant ectoparasites of root tips, sides of succulent roots	Devitalized root tips, necrosis of small roots, gall-like swellings, clusters of small stubby branches	Soil fumigation	14,44,54	25

1	Adenovirus	Man, cattle, chicken, dog, monkey, mouse	Respiratory and intestinal tracts	NP secretions	Man (?), dog (?), suckling hamster	Human tumor, monkey kidney, dog and chick embryo	85 (em)	Variable pathogenicity; may agglutinate RBC
2	Bluetongue	Cattle, sheep	Blood, all organs	*Culicoides* midge	Goat, hamster, suckling mouse	Sheep kidney (+)	100-150 (mf)	Several antigenic types
3	Chicken pox (varicella)	Man	Fluid and crusts of cutaneous lesions	Air-borne contact		Human foreskin and embryo	210-243 (em)	Antigenically identical to herpes zoster
4	Cowpox	Man, cattle	Cutaneous lesions on teat and udder	Contact with discharge from lesion, hands of milker	Rabbit, guinea pig	Cattle fetus, skin (+)		Antigenically related to vaccinia
5	Coxsackie	Man	Feces, blood, pharynx, saliva, CNS	Ingestion	Suckling mouse; hamster, monkey, chimpanzee	Newborn mouse; human, chick, monkey, and mouse embryo (+)	37 (em)	Thirty or more antigenic types
6	Dengue	Man, mosquito	Blood	*Aedes* mosquito	Mouse	Monkey kidney (+)	17-25 (mf)	Four antigenic types
7	Distemper, canine	Dog, ferret, other carnivores	Blood, secretions, excretions	Contact with secretions, excretions	Ferret, hamster, suckling mouse	Dog kidney (+)	20-22 (em)	Classical, neurotrophic, hard-pad types
8	Encephalitis, western equine	Man, horse, domestic and wild birds	CNS, blood, spleen	*Culex* mosquito	Mouse, many domestic and wild animals	Human and chick embryo, hamster and monkey kidney (+)	25 (mf); 40 (c, em)	Antigenically distinct; Arbor group A
9	Foot-and-mouth disease	Man, cattle, goat, sheep, swine	Blood, saliva, milk, urine	Contact with secretions, excretions; raw garbage	Rabbit, guinea pig, young dog, mouse, rat, chick	Guinea pig and cattle epithelium (+)	22 (em)	Three or more antigenic types; agglutinates RBC
10	Fowl plague	Domestic fowl, some wild birds	Blood, secretions, excretions	Ingestion	Starling, canary, mouse, rat, rabbit, ferret	Chick embryo (+)	60-140 (mf, c, em)	Antigenic variants; agglutinates RBC
11	Herpes simplex	Man	Skin, cornea, blood, mucosa, CNS	Contact ?	Rabbit, mouse	Rabbit and chick embryo (+)	100-150 (mf)	Antigenically related to pseudorabies, B-viruses
12	Hog cholera	Swine	Blood, all secretions, excretions	Contact with secretions, excretions, raw garbage	Rabbit, guinea pig	Swine marrow, testis, spleen, kidney, white blood cells	27 (em)	Antigenic, neurotrophic variants
13	Infectious hepatitis	Man	Blood, feces	Ingestion	Man ?	HeLa and other human cells ?	Passes Seitz	Two antigenic types
14	Influenza	Man	Respiratory tract	Contact with NP secretions	Ferret, mouse	Chick embryo (+)	80-120 (mf, c, em)	Antigenic types A-C; agglutinates RBC
15	Louping ill	Man, cattle, sheep	CNS, blood; CSF (man)	Tick; contact with infected animals (man)	Mouse, vole, swine, cattle, monkey	Chick embryo (+)	15-20 (mf); 22-27 (c)	Antigenically related to Russian Far East virus
16	Lymphogranuloma venereum	Man	Genital lesion, CSF, inguinal lymph node	Direct contact with lesion or exudate	Mouse, guinea pig, monkey	Chick and mouse embryo; guinea pig and mouse testis (+)	300 (dm); 438 (em)	Antigenically related to psittacosis; produces toxin

/1/ Growth in embryonated chicken egg indicated by plus sign in parentheses. /2/ Method of determination given in parentheses: (c) = centrifugation; (dm) = direct microscopy; (em) = electron microscopy; (mf) = membrane filtration.

	Virus	Natural Host	Location in Natural Infection	Natural Trans-mission	Experi-mental Host	Tissue Culture (Growth in Egg[1])	Esti-mated Size[2] mμ	Remarks
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
17	Measles (rubeola)	Man	Blood, skin, respiratory tract, urine	Contact with NP secretions	Monkey	Chick embryo, human and monkey kidney (+)	120-150 (em)	
18	Measles, German (rubella)	Man	Respiratory tract, blood, urine	Contact with NP secretions	Man ?	Human amnion, monkey kidney	<800 (mf)	May produce fetal malformation
19	Molluscum contagiosum	Man	Skin	Direct contact		HeLa cells	190-250 (em)	
20	Mumps	Man	Salivary glands, blood, gonads, CSF	Droplets of saliva	Monkey, hamster	Chick and mouse embryo (+)	90-135 (mf); 140-268 (em)	Agglutinates RBC; produces hemolysin
21	Newcastle disease	Man, cattle, domestic fowl, some wild birds	Conjunctival and nasal secretions (man); lungs (calf); blood, secretions, excretions (ovipara)	Contact with secretions, excretions, sick animals; raw garbage (poultry scraps)	Common laboratory animals, cattle, quail, sparrow	Chick embryo, chicken trachea cells, swine embryo lymph node (+)	70-180 (em)	Neural pneumonic visceral strains; agglutinates RBC
22	Parainfluenza	Man, cattle	Respiratory tract	Contact with NP secretion		Monkey and cattle kidney	80-150 (em)	Four or more antigenic types
23	Poliomyelitis	Man	CNS, intestinal tract, blood	Ingestion	Chimpanzee, monkey, hamster, mouse	Human, monkey	28 (em)	Three antigenic types
24	Polyoma	Mouse	Blood, tissues, excretions	Contact	Suckling mouse, hamster, and rat	Mouse embryo	45 (em)	Tumorigenic for newborn mice; agglutinates RBC
25	Psittacosis	Man, psittacine birds, duck, chicken	Lung, spleen, liver, sputum (man); respiratory secretions, cloacal contents	Inhalation of dried secretions, droppings, contact with infected tissues	Mouse, guinea pig, monkey	Chick embryo, mouse (+)	455 (em)	Produces toxin
26	Rabies	All mammals	CNS, salivary and lacrimal glands, kidney, pancreas, saliva	Through broken epithelium contaminated with saliva	Mammals, domestic fowl	Rabbit, rat, mouse, chick embryo (+)	100-150 (mf)	
27	Reovirus	Man, cattle, monkey, mouse	Intestinal tract	Ingestion ?	Man ?	Human, monkey	60-90 (em)	Three antigenic types; agglutinates RBC
28	Rift Valley fever	Man, sheep	Blood, liver	Mosquito ?	Cattle, goat, monkey, mouse	Chick embryo (+)	23-35 (mf)	
29	Rinderpest	Domestic animals, deer	Blood, secretions, excretions	Ingestion	Rabbit, guinea pig, Chinese pig	Chick embryo (+)	Passes V Berkefeld	
30	Rous sarcoma	Chicken	Tumor, blood	Contact, egg	Chick, turkey	Chick embryo (+)	65-90 (em)	One of several related tumorigenic chicken viruses
31	Shope papilloma	Rabbit	Skin		Domestic rabbit, hamster		22-35 (mf); 32-50 (c)	Malignancy becomes carcinomatous
32	Silkworm jaundice	*Bombyx mori*	Fat, hypodermis, blood cells; other tissues ?	Oral; egg ?	Gypsy moth (?), nun moth ?		40-288 (em)	Inclusion bodies: polyhedral

/1/ Growth in embryonated chicken egg indicated by plus sign in parentheses. /2/ Method of determination given in parentheses: (c) = centrifugation; (dm) = direct microscopy; (em) = electron microscopy; (mf) = membrane filtration.

132. VIRAL DISEASES: ANIMALS

	Virus	Natural Host	Location in Natural Infection	Natural Transmission	Experimental Host	Tissue Culture (Growth in Egg[1])	Estimated Size[2] mμ	Remarks
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
33	Smallpox (variola)	Man; monkey ?	Cutaneous lesions, NP secretions, mucosa, blood	Inhalation of secretions, scabs	Monkey, rabbit	Human embryo, skin, kidney, tumor, etc. (+)	244-302 (em)	Antigenically related to vaccinia; agglutinates RBC
34	Trachoma	Man	Conjunctiva, conjunctival exudate	Contact with conjunctival exudate	Ape; man ?	(+)	250 (dm)	
35	Vaccinia	Man (?), rabbit (?), cattle ?	Cutaneous lesions ?		Man, cattle, monkey, rabbit, mouse	Rabbit, chicken; guinea pig adult and embryo (+)	236-252 (mf)	Antigenically related to smallpox; agglutinates RBC
36	Wart (verruca)	Man	Cutaneous lesions	Contact ?	Man ?		Passes N Berkefeld	
37	Yellow fever	Man, monkey	Blood, liver, CNS, spleen, lymph nodes	*Aedes aegypti* and other culicines	Mouse, monkey, hedgehog	Chick and mouse embryo (+)	12-19 (c); 22 (mf)	Arbor group B

/1/ Growth in embryonated chicken egg indicated by plus sign in parentheses. /2/ Method of determination given in parentheses: (c) = centrifugation; (dm) = direct microscopy; (em) = electron microscopy; (mf) = membrane filtration.

133. VIRAL DISEASES: PLANTS

	Host Plant and Disease	Distribution	Principal Insect Vector	Other Means of Transmission	Symptoms
	(A)	(B)	(C)	(D)	(E)
	Allium cepa (garden onion)				
1	Onion yellow dwarf	United States, Germany, New Zealand, USSR	Aphids (including *Aphis maidis, A. rumicis)*	Leaf rubbing	Leaves yellowed, crinkled; plants dwarfed; bulbs small; few seeds
	Beta vulgaris (beet)				
2	Beet yellows	Belgium, Netherlands, Denmark, England	Aphids (including *Aphis fabae, Myzus persicae)*	....	Leaves yellow, thick, brittle; necrosis in secondary phloem
3	Sugar beet curly top	Western North America	Leafhopper *(Circulifer tenellus)*	Grafting; dodder	Leaves curled, enations on veins; plant stunted; many rootlets

continued

133. VIRAL DISEASES: PLANTS

	Host Plant and Disease	Distribution	Principal Insect Vector	Other Means of Transmission	Symptoms
	(A)	(B)	(C)	(D)	(E)
	Cucumis sativus (cucumber)				
4	Cucumber mosaic	Almost worldwide	Aphids (including *Aphis gossypii, Myzus persicae*)	Leaf rubbing; dodder	Leaves mottled, distorted, small; plant stunted; fruits mottled
5	Cucurbit mosaic	England	....	Leaf rubbing	Chlorotic mottling and distortion of foliage; plant stunted
	Fragaria hybrida (strawberry)				
6	Strawberry stunt	United States	Aphid *(Capitophorus fragaefolii)*	Grafting	Leaves green, luster dull; leaflets cupped; plant stunted; fruits small
	Gossypium hirsutum (upland cotton)				
7	Cotton leaf curl	Sudan, Nigeria	Whitefly *(Bemisia gossypiperda)*	Grafting	Leaves pale-spotted, puckered, unsymmetrical; internodes shortened
	Lactuca sativa (lettuce)				
8	Lettuce mosaic	Worldwide	Aphids *(Macrosiphum gei, Myzus persicae)*	Leaf abrasion; seeds	Clearing of veins, followed by systemic chlorotic mottling
	Lycoperiscon esculentum (tomato)				
9	Tomato bushy stunt	British Isles	....	Leaf rubbing; dodder	Foliage yellowed; plant stunted; axillary buds stimulated
10	Tomato spotted wilt	Almost worldwide	*Frankliniella moultoni, F. schultzei, Thrips tabaci*	Leaf abrasion	Bronze-ring lesions, necrosis or mottling; fruit discolored
	Medicago sativa (alfalfa)				
11	Alfalfa mosaic	United States	Aphids *(Macrosiphum pisi, M. solanifolii)*	Leaf rubbing	Systemic chlorotic mottling, often masked
	Nicotiana tabacum (common tobacco)				
12	Tobacco etch	United States	Aphids (especially *Myzus persicae*)	Leaf rubbing	Systemic chlorotic mottling with traces of whitish etching
13	Tobacco leaf curl	Africa, India, Sumatra, Formosa	Whitefly *(Bemisia gossypiperda)*	Grafting	Leaves curled, wrinkled; veins thick, enations; plant stunted
14	Tobacco mosaic	Worldwide	....	Leaf rubbing; dodder; soil	Systemic chlorotic mottling; some distortion of leaves
15	Tobacco necrosis	United States, British Isles, Australia	....	Leaf rubbing; soil; fungus vector (*Olpidium* spp.)	Necrosis in midrib and veins of lower leaves in winter
16	Tobacco ring spot	United States	....	Leaf rubbing; seeds; nematode vector *(Xiphinema americanum)*	Necrotic, ringlike primary and secondary lesions; later recovery
	Oryza sativa (rice)				
17	Rice dwarf	Japan, Philippine Islands	Leafhoppers (including *Nephotettix apicalis*)	....	Leaves chlorotic, spotted, streaked; internodes and roots short
	Phaseolus vulgaris (kidney bean)				
18	Bean mosaic	Almost worldwide	Aphids (including *Aphis rumicis*)	Leaf abrasion; seeds	Systemic chlorotic mottling
19	Southern bean mosaic	Southern United States	....	Leaf rubbing; seeds	Mottling in some varieties, localized or systemic necrosis in others

continued

133. VIRAL DISEASES: PLANTS

	Host Plant and Disease	Distribution	Principal Insect Vector	Other Means of Transmission	Symptoms
	(A)	(B)	(C)	(D)	(E)
	Prunus persica (peach)				
20	Peach phony disease	Southeastern United States	Leafhoppers (including *Homalodisca triquetra*)	Root grafting	Foliage abnormally green; tree dwarfed, fruit small
21	Peach rosette	United States	....	Budding; dodder	Stems short with dwarfed leaves; veins thickened; tree dies soon
22	Peach X-disease	United States	Leafhoppers (including *Colladonus clitellarius*)	Budding	Leaves light green, tattered; old leaves drop; fruit bitter
23	Peach yellows	Eastern United States, eastern Canada	Leafhopper *(Macropsis trimaculata)*	Budding	Leaves chlorotic; shoots erect, thin, numerous; tree dies soon
	Solanum tuberosum (potato)				
24	Potato aucuba mosaic	United States, Europe	Probably aphid *(Myzus persicae)*	Leaf rubbing	Yellow mottling of foliage; some necrosis in tubers
25	Potato leaf roll	Wherever potatoes are grown	Aphids (especially *Myzus persicae*)	Grafting	Leaves thick, leathery, rolled, starchy; plant small; few tubers
26	Potato mild mosaic	United States, England, Holland	Aphids *(Aphis abbreviata, Myzus persicae)*	Leaf rubbing	Mild chlorotic mottling or masked symptoms in most varieties
27	Potato mottle	Worldwide	....	Leaf rubbing; root and leaf contacts	No obvious disease, or very mild chlorotic mottling
28	Potato spindle tuber	United States, Canada	Aphids *(Macrosiphum solanifolii, Myzus persicae)*	Leaf rubbing; seed-piece cutting	Leaves small, erect, dark green; plant brittle; tubers tapered
29	Potato veinbanding	United States, Brazil, England, France	Aphids (especially *Myzus persicae*)	Leaf rubbing	Chlorotic mottling, necrotic stemstreak, or no obvious disease
30	Potato witches'-broom	United States, USSR	....	Tuber core graft, stem graft	Leaves small, pale; branches numerous, spindly; tubers small
31	Potato yellow dwarf	United States, Canada	Leafhopper *(Aceratagallia sanguinolenta)*	Leaf abrasion in some hosts; grafting	Leaves yellowed, plant dwarfed; tubers few, small, often cracked
	Trifolium incarnatum (crimson clover)				
32	Clover club leaf	United States (New Jersey)	Leafhopper *(Agalliopsis novella)*	....	Plant dwarfed; leaves small, yellowed or reddened at margins
33	Wound tumor	United States	Leafhoppers *(Agallia constricta, Agalliopsis novella)*	....	Experimentally: veins thickened, enations; plant dwarfed
	Triticum aestivum (wheat)				
34	Wheat mosaic	United States, Japan	....	Leaf abrasion; soil	Systemic chlorotic mottling; dwarfing; vacuolate inclusions
35	Wheat streak mosaic	United States, Canada	Mite *(Aceria tulipae)*	Leaf abrasion	Systemic chlorotic mottling, streaking of leaves
36	Winter-wheat mosaic	USSR	Leafhopper *(Deltocephalus striatus)*	....	Chlorotic mottling; phloem necrosis, vacuolate inclusions
	Zea mays (corn)				
37	Maize streak	Africa	Leafhoppers *(Cicadulina mbila, C. storeyi, C. zeae)*	....	Chlorotic spotting, streaking of leaves

134. RICKETTSIAL PARASITES: MAMMALS AND BIRDS

Host (column B): Animals are listed in order of decreasing susceptibility.

	Species	Host	Disease or Disorder	Method of Transmission
	(A)	(B)	(C)	(D)
1	*Anaplasma centrale*	Cattle	Benign anaplasmosis	Tick to host
2	*A. marginale*	Cattle	Malignant anaplasmosis	Tick to host
3	*A. ovis*	Sheep, goat	Ovine anaplasmosis	Tick to host
4	*Bartonella bacilliformis*	Man	Oroya fever	Sand fly to man
5	*Chlamydia oculogenitalis*	Man	Inclusion blennorrhea, inclusion conjunctivitis, neonatal conjunctivitis	Contact; contaminated swimming pools
6	*C. trachomatis*	Man, ape, monkey	Trachoma	Contact
7	*Colesiota conjunctivae*	Sheep, cattle, goat	Ophthalmia	Uncertain
8	*Colletsia pecoris*	Cattle, sheep, goat	Conjunctivitis ?	Uncertain
9	*Cowdria ruminantium*	Goat, sheep, cattle	Heartwater	Tick feces; tick to host
10	*Coxiella burneti*	Man, cattle, sheep, goat	Q fever	Tick feces; host to tick to host; contact with domestic animals; inhalation of infected dust; contaminated milk
11	*Ehrlichia bovis*	Cattle	Bovine rickettsiosis	Tick to host
12	*E. canis*	Dog	Canine rickettsiosis	Tick to host
13	*E. ovina*	Sheep	Ovine rickettsiosis	Presumed tick to host
14	*E. phagocytophila*	Sheep	Ovine rickettsiosis	Tick to host
15	*Eperythrozoon* spp.	Cattle, mouse, sheep, swine	Eperythrozoonosis, anemia	Mouse louse to mouse (other arthropods suspected)
16	*Grahamella talpae*	Mole	Grahamellosis, anemia	Uncertain
17	*Haemobartonella* spp.	Animals	Haemobartonellosis, anemia	Flea to host
18	*Miyagawanella bronchopneumoniae*	Mouse	Mouse pneumonitis	Contact
19	*M. felis*	Cat	Feline pneumonitis	Contact
20	*M. lymphogranulomatosis*	Man	Lymphogranuloma venereum (lymphogranuloma inguinale)	Venereal contact
21	*M. ornithosis*	Man, nonpsittacine birds	Ornithosis	Inhalation of infected dust; bird to man, man to man
22	*M. psittaci*	Man, psittacine birds	Psittacosis	Inhalation of infected dust; bird to man, man to man
23	*Neorickettsia helminthoeca*	Dog, fox, coyote	Salmon poisoning	Intestinal parasitic fluke to dog
24	*Rickettsia akari*	Man	Rickettsial pox	Mite to man
25	*R. conorii*	Man; dog as reservoir	Boutonneuse (Marseilles, Mediterranean) fever	Tick to man
26	*R. prowazekii*	Man	Epidemic (classic Old World) typhus	Louse feces; man to louse to man
27	*R. rickettsii*	Man, rabbit, squirrel	Rocky Mountain spotted fever	Tick to man
28	*R. siberica*	Man, rodents	Siberian tick typhus	Tick to host
29	*R. tsutsugamushi*	Man, monkey, rodents	Tsutsugamushi fever (scrub typhus)	Mite to man
30	*R. typhi*	Man, rodents	Murine or endemic typhus	Flea feces; rat to flea to man
31	*Ricolesia bovis*	Cattle	Infectious conjunctivitis	Contact
32	*R. caprae*	Goat	Infectious conjunctivitis	Possibly contact
33	*R. conjunctivae*	Fowl	One form of ocular roup	Possibly contact
34	*R. lestoquardii*	Swine	Infectious conjunctivitis	Possibly contact
35	*Rochalimaea quintana*	Man	Trench fever	Body louse to man

135. BACTERIAL PARASITES: MAMMALS AND BIRDS

Host (column B): Animals are listed in order of decreasing susceptibility.

	Species (A)	Host (B)	Disease or Disorder (C)	Method of Transmission (D)
1	*Actinobacillus lignieresii*	Cattle, swine	Actinobacillosis (wooden tongue)	Not definitely known
2	*A. mallei*	Horse, man	Glanders	Contact; contaminated feed, water
3	*Actinomyces bovis*	Cattle, swine, horse, man	Actinomycosis (lumpy jaw)	Buccal cavity; transmission not definitely known
4	*Bacillus anthracis*	Man	Anthrax	Soil-borne; contact with infected animal by-products, carcasses
5		Cattle, sheep, horse, mule, swine	Anthrax (splenic fever)	Soil-borne; infected feed, water, carcasses
6	*Bordetella pertussis*	Man	Whooping cough	Flora of respiratory tract; droplet infection
7	*Borrelia anserina*	Fowl	Spirochetosis	Arthropod vector; feces-borne
8	*B. recurrentis*	Man	European relapsing fever	Arthropod vector
9	*B. theileri*	Cattle	Spirochetosis	Arthropod vector
10	*B. vincentii*	Man	Associated with *Fusobacterium fusiforme* in Vincent's angina	Buccal cavity; transmission not definitely known
11	*Brucella abortus*	Cattle, man	Brucellosis (undulant fever)	Ingestion of infected milk; contact
12	*B. melitensis*	Goat, sheep, man	Brucellosis (undulant fever)	Ingestion of infected milk; contact
13	*B. suis*	Swine, man	Brucellosis (undulant fever)	Contact
14	*Clostridium botulinum*	Man, chicken, duck, horse, mule, cattle	Botulism, food intoxication, limberneck of fowl	Ingestion of toxin in food
15	*C. chauvoei*	Cattle, man	Blackleg, symptomatic anthrax	Soil-borne; wound infection
16	*C. haemolyticum*	Cattle, sheep	Icterohemoglobinuria	Soil-borne; contaminated feed, water
17	*C. novyi*	Sheep, man	Infectious necrotic hepatitis	Soil-borne; associated with liver fluke infection
18	*C. perfringens*	Man	Gas gangrene	Soil-borne; wound infection
19		Sheep	Dysentery in lamb, infectious enterotoxemia	Soil-borne; wound infection
20	*C. septicum*	Horse, sheep, cattle, man	Malignant edema	Soil-borne; wound infection
21	*C. tetani*	Man, sheep, cattle, goat, swine, horse	Tetanus (lockjaw)	Soil-borne; wound infection
22	*Corynebacterium diphtheriae*	Man	Diphtheria	Carrier contact
23	*C. equi*	Horse	Pneumonia of foal	Possible in utero
24		Swine	Submaxillary gland infection	Contaminated soil, feed
25	*C. pseudotuberculosis*	Sheep, goat	Caseous lymphadenitis	Contaminated feed, water
26		Horse, deer, elk, moose, mountain sheep	Ulcerative lymphangitis (pseudoglanders)	Contact; wound infection
27	*C. pyogenes*	Cattle, swine, sheep, goat, deer	Mastitis, purulent infections, arthritis	Inhabits mucous membranes; contact; wound infection

continued

135. BACTERIAL PARASITES: MAMMALS AND BIRDS

	Species	Host	Disease or Disorder	Method of Transmission
	(A)	(B)	(C)	(D)
28	*Corynebacterium renale*	Cattle, swine	Pyelonephritis	Inhabits mucous membranes; transmission not definitely known
29	*Diplococcus pneumoniae*	Man	Lobar pneumonia, meningitis, endocarditis	Carrier contact
30	*Erysipelothrix insidiosa*	Man	Erysipeloid	Wound infection; contact with infected carcasses
31		Swine, sheep, fowl	Erysipelas	Feces-borne; contaminated soil, feed, water
32	*Escherichia coli*	Man, domestic animals	Genitourinary and intestinal infections	Feces-borne; normal flora of intestinal tract.
33	*Fusobacterium fusiforme*	Man	Associated with ulcerative stomatitis (Vincent's angina)	Buccal cavity; transmission not definitely known
34	*Haemophilus ducreyi*	Man	Soft chancre, chancroid	Direct genital contact
35	*H. gallinarum*	Chicken	Infectious coryza	Contact
36	*H. haemoglobinophilus*	Dog	Prepucial infection	Direct sexual contact
37	*H. influenzae*	Man	Meningitis, obstructive respiratory infections	Flora of respiratory tract; droplet infection
38	*H. suis*	Swine	Associated with viral influenza	Contact; flora of respiratory tract
39	*Klebsiella pneumoniae*	Man, horse, cattle	Respiratory infection; mastitis (cattle)	Contact; flora of respiratory tract
40	*Leptospira canicola*	Dog, man, swine, cattle	Leptospirosis (Stuttgart's disease of dog)	Direct contact; contamination of water by infected urine
41	*L. icterohaemorrhagiae*	Man, dog, swine, cattle, rodents	Leptospirosis (Weil's disease)	Direct contact; contamination of water by infected urine
42	*L. pomona*	Cattle, swine, man	Leptospirosis (swineherd's disease)	Direct contact; contamination of water by infected urine
43	*Listeria monocytogenes*	Man, domestic animals, fowl	Listeriosis, meningoencephalitis, abortion	Not definitely known
44	*Moraxella bovis*	Cattle	Infectious keratitis	Contact
45	*M. lacunata*	Man	Conjunctivitis	Not definitely known
46	*Mycobacterium avium*	Fowl, swine	Tuberculosis	Contact; feces-borne; contaminated feed, water
47	*M. bovis*	Cattle, man, swine	Tuberculosis	Contact; feces-borne; contaminated feed, water, milk
48	*M. leprae*	Man	Hansen's disease (leprosy)	Not definitely known
49	*M. paratuberculosis*	Cattle, sheep	Johne's disease	Contact; feces-borne; contaminated feed, water
50	*M. tuberculosis*	Man	Tuberculosis	Contact; via respiratory or alimentary tract
51	*Neisseria catarrhalis*	Man	Catarrhal inflammations	Flora of respiratory tract
52	*N. gonorrhoeae*	Man	Gonorrhea	Direct sexual contact
53	*N. meningitidis*	Man	Epidemic cerebrospinal meningitis	Infection from respiratory tract of carrier
54	*Pasteurella multocida*	Domestic animals, fowl, man	Hemorrhagic septicemia, bronchiectasis, conjunctivitis	Contact; contaminated feed, water; bites
55	*P. pestis*	Man, rodents	Bubonic and pneumonic plague	Flea bite from infected rat; droplet infection
56	*P. pseudotuberculosis*	Guinea pig, rabbit, horse, cattle, goat, rodents, dog, cat, monkey, fowl	Pseudotuberculosis	Soil-borne; contaminated water, fodder, milk
57	*P. tularensis*	Man, rodents, lagomorphs	Tularemia	Contact with contaminated carcasses; insect vector
58	*Proteus vulgaris*	Man	Genitourinary and intestinal infections	Feces-borne
59	*Pseudomonas aeruginosa*	Man, animals	Suppurative processes, septicemia, meningitis, genitourinary infections	Contaminated water, soil, feces; wound infection
60	*Salmonella enteritidis*	Man, rodents	Food poisoning, gastroenteritis	Feces-borne
61	*S. gallinarum*	Fowl	Fowl typhoid, bacillary white diarrhea	Feces-borne; ovarian transmission
62	*S. hirschfeldii*	Man	Paratyphoid fever	Feces-borne
63	*S. paratyphi A*	Man	Paratyphoid fever	Feces-borne
64	*S. paratyphi B*	Man	Paratyphoid fever	Feces-borne
65	*S. typhimurium*[1]	Man, rodents	Food poisoning, gastroenteritis	Feces-borne

/1/ A natural pathogen for all warm-blooded animals

135. BACTERIAL PARASITES: MAMMALS AND BIRDS

	Species	Host	Disease or Disorder	Method of Transmission
	(A)	(B)	(C)	(D)
66	*Salmonella typhosa*	Man	Typhoid fever	Feces-borne
67	*Shigella dysenteriae*	Man	Dysentery	Feces-borne; contaminated food, water
68	*S. equirulis*	Horse	Joint infection, nephritis	Possible in utero
69	*Sphaerophorus necrophorus*	Man ?	Associated with ulcerative colitis ?	Feces-borne; associated with unsanitary conditions
70		Horse	Gangrenous dermatitis (scratches)	Feces-borne; associated with unsanitary conditions
71		Cattle	Calf diphtheria	Feces-borne; associated with unsanitary conditions
72		Sheep, goat	Lip-and-leg ulceration, ulcerative stomatitis, foot rot	Feces-borne; associated with unsanitary conditions
73		Swine	Ulcerative stomatitis, enteritis	Feces-borne; associated with unsanitary conditions
74	*Spirillum minus*	Man, rodents	Rat-bite fever	Rat bite
75	*Staphylococcus aureus*	Man, animals	Suppurative processes, food poisoning, septicemia	Wound infection; contaminated food; flora of skin and mucous membranes
76	*Streptococcus agalactiae*	Cattle	Mastitis	Contaminated milking equipment
77	*S. dysgalactiae*	Cattle	Mastitis	Contaminated milking equipment
78	*S. equi*	Horse	Strangles	Contact; contaminated water, feed
79	*S. pyogenes*	Man, vole	Scarlet fever, septic sore throat	Direct personal contact; contaminated milk
80	*S. uberis*	Cattle	Mastitis	Contaminated milking equipment
81	*Treponema pallidum*	Man	Syphilis	Direct sexual contact
82	*Vibrio comma*	Man	Cholera	Feces-borne from carrier; contaminated food, water
83	*V. fetus*	Cattle, sheep	Vibrionic abortion, sterility	Direct sexual contact
84	*V. jejuni*	Cattle	Dysentery	Feces-borne; contaminated feed and water

121	*P. medicaginis*	Common leaf spot
122	*Sclerotinia trifoliorum*	Crown rot, root rot
123	*Uromyces striatus*	Rust
124	*Urophlyctis alfalfae*	Crown wart
	Nicotiana tabacum (common tobacco)	
125	*Cercospora nicotianae*	Frogeye leaf spot
126	*Fusarium oxysporum*	Fusarium wilt
127	*Macrophomina phaseoli*	Charcoal rot
128	*Pellicularia filamentosa*	Stem canker
129	*Peronospora tabacina*	Blue mold
130	*Phytophthora parasitica*	Black shank
131	*Thielaviopsis basicola*	Black rot
	Oryza sativa (rice)	
132	*Cercospora oryzae*	Cercospora spot
133	*Cochliobolus miyabeanus*	Helminthosporium blight
	Persea americana (American avocado)	
134	*Botryosphaeria ribis*	Branch canker, fruit rot
135	*Cercospora purpurea*	Cercospora spot or blotch
136	*Colletotrichum gloeosporioides*	Anthracnose or black spot
137	*Diplodia theobromae*	Stem-end rot
138	*Phomopsis* spp.	Stem-end rot
139	*Phytophthora cinnamomi*	Phytophthora root rot
140	*Sphaceloma perseae*	Scab[4]
141	*Verticillium albo-atrum*	Verticillium wilt
	Phaseolus vulgaris (kidney bean)	
142	*Colletotrichum lindemuthianum*	Anthracnose
143	*Erysiphe polygoni*	Powdery mildew
	Phaseolus vulgaris (kidney bean)	
144	*Fusarium phaseoli, F. solani*	Root rot
145	*Macrophomina phaseoli*	Ashy stem blight, charcoal rot, leaf spot, root rot
146	*Sclerotinia sclerotiorum*	White mold (sclerotinia wilt)
147	*Sclerotium rolfsii*	Southern blight
148	*Uromyces phaseoli*	Rust
	Pisum sativum (garden pea)	
149	*Aphanomyces euteiches*	Root rot
150	*Ascochyta pinodella*	Ascochyta foot rot
151	*A. pisi*	Ascochyta leaf and pod spot
152	*Colletotrichum pisi*	Anthracnose
153	*Erysiphe polygoni*	Powdery mildew
154	*Fusarium oxysporum pisi*, strain 1	Fusarium wilt
155	*F. oxysporum pisi*, strain 2	Near wilt
156	*F. solani*	Root rot
157	*Mycosphaerella pinodes*	Mycosphaerella blight
158	*Peronospora viciae*	Downy mildew
	Prunus amygdalus (almond)	
159	*Armillaria mellea*	Root rot
160	*Coryneum carpophilum*	Blight, shot hole
161	*Monilinia fructicola*	Peach brown rot
162	*M. laxa*	Brown rot, blossom blight
	Prunus domestica (garden plum)	
163	*Armillaria mellea*	Root rot
164	*Dibotryon morbosum*	Black knot
165	*Monilinia fructicola*	Brown rot, blossom blight
166	*M. laxa*	European brown rot, blossom and twig blight
	Prunus persica (peach)	
167	*Armillaria mellea*	Root rot
168	*Clitocybe tabescens*	Root rot
169	*Coryneum carpophilum*	Blight, shot hole
170	*Glomerella cingulata*	Ripe rot, twig blight
171	*Monilinia fructicola*	Brown rot, twig canker
172	*Taphrina deformans*	Leaf curl
	Pyrus communis (pear)	
173	*Botrytis cinerea*	Gray mold
174	*Clitocybe tabescens*	Root rot
175	*Neofabraea malicorticis*	Black spot canker
176	*N. perennans*	Perennial canker
177	*Podosphaera leucotricha*	Powdery mildew
178	*Venturia pyrina*	Scab
	Solanum tuberosum (potato)	
179	*Alternaria solani*	Early blight
180	*Fusarium* spp.	Wilt and tuber rot
181	*Phytophthora infestans*	Late blight
182	*Streptomyces scabies*	Common scab
183	*Verticillium albo-atrum*	Verticillium wilt
	Trifolium spp. (clover)	
184	*Colletotrichum trifolii*	Southern anthracnose

/4/ Disease of fruit and foliage.

Part I. FIELD, FRUIT, AND VEGETABLE CROPS

	Host Plant and Pathogen	Disease
	(A)	(B)
	Trifolium spp. (clover)	
185	*Cymadothea trifolii*	Sooty blotch[5]
186	*Erysiphe polygoni*	Powdery mildew[6]
187	*Kabatiella caulivora*	Northern anthracnose[7]
188	*Phoma herbarum medicaginis*	Spring black stem[6]
189	*Pseudoplea trifolii*	Leaf spot
	Triticum aestivum (wheat)	
190	*Erysiphe graminis*	Powdery mildew
191	*Gibberella zeae*	Fusarium blight (scab)
192	*Helminthosporium sativum*	Crown rot, root rot
193	*Leptosphaeria nodorum*	Glume blotch, node canker
194	*Ophiobolus graminis*	Take-all
195	*Puccinia glumarum*	Stripe rust
196	*P. graminis*	Stem rust
197	*P. rubigo-vera*	Leaf rust
198	*Septoria tritici*	Leaf blotch
199	*Tilletia brevifaciens*	Dwarf bunt
200	*T. caries*, *T. foetida*	Bunt (stinking smut)
201	*Urocystis tritici*	Flag smut
202	*Ustilago tritici*	Loose smut

	Host Plant and Pathogen	Disease
	(A)	(B)
	Vitis spp. (grape)	
203	*Cryptosporella viticola*	Dead-arm
204	*Elsinoe ampelina*	Anthracnose
205	*Guignardia bidwellii*	Black rot
206	*Plasmopara viticola*	Downy mildew
207	*Uncinula necator*	Powdery mildew
	Zea mays (corn)	
208	*Cochliobolus heterostrophus*	Southern leaf blight, seedling blight
209	*Diplodia macrospora*, *D. zeae*	Stalk rot, dry ear rot
210	*Gibberella fujikuroi*	Pink ear rot, seedling blight
211	*G. zeae*	Stalk rot, red ear rot, seedling blight, root rot
212	*Helminthosporium carbonum*	Northern leaf spot, charred ear, seedling blight
213	*H. turcicum*	Northern leaf blight, seedling blight
214	*Physalospora zeae*	Gray ear rot
215	*Puccinia sorghi*	Rust
216	*Sclerospora graminicola*	Downy mildew
217	*Ustilago maydis*	Smut

/5/ Disease of red, white, and alsike clover. /6/ Disease of red clover. /7/ Disease of crimson and red clover.

111	*G. trachysorum*	Fusiform gall rust of juniper
112	*G. tuberlatum*	Globoid gall rust of mountain juniper
113	*G. vauqueliniae*	Witches'-broom of vauquelinia
114	*Phomopsis juniperovora*	Juniper blight
	Larix occidentalis (western larch)	
115	*Fomes laricis*	Brown trunk rot
116	*Hypodermella laricis*	Needle cast
117	*Melampsora bigelowii, M. medusae*	Needle rust
118	*Sparassis radicata*	Sparassis root rot
	Picea glauca (white spruce)	
119	*Chrysomyxa cassandrae, C. chiogenis, C. empetri, C. ledi, C. ledicola*	Needle rust
120	*C. pyrolae*	Spruce cone rust
121	*Peridermium coloradense*	Witches'-broom
122	*Pucciniastrum americanum, P. arctium*	Needle rust
123	*Rhizina inflata*	Rhizina root rot
	Pinus ponderosa (western yellow pine)[1]	
124	*Atropellis arizonica, A. piniphila*	Atropellis canker
125	*Coleosporium solidaginis*	Needle rust
126	*Cronartium comandrae*	Comandra blister rust
127	*C. comptoniae*	Sweet-fern blister rust
128	*C. filamentosum*	Paintbrush blister rust
129	*C. harknessii*	Western gall rust
130	*C. quercuum*	Gall rust
131	*Dasyscypha ellisiana*	Dasyscypha canker
132	*Elytroderma deformans*	Witches'-broom, needle cast
133	*Fomes laricis*	Brown cubical rot
134	*F. pini*	Red ring rot
135	*Hypodermella medusa*	Needle cast
136	*Lentinus lepideus*	Brown cubical rot
	Pinus strobus (eastern white pine)[2,3]	
137	*Armillaria mellea*	Shoestring root rot
138	*Atropellis pinicola*	Atropellis canker
139	*Bifusella linearis*	Needle cast
140	*Caliciopsis pinea*	Caliciopsis canker
141	*Cronartium ribicola*	White pine blister rust
142	*Fomes annosus*	Root and butt rot
	Pinus strobus (eastern white pine)[2,3]	
143	*Fomes laricis*	Brown cubical rot
144	*F. pini*	Red ring rot
145	*Hypoderma desmazierii*	Needle cast
146	*Lentinus lepideus*	Brown cubical rot
147	*Lophodermium pinastri*	Needle cast
148	*Neopeckia coulteris*	Brown felt blight
149	*Phacidium planum*	Needle blight
150	*Polyporus circinatus*	Red root and butt rot
151	*Sparassis radicata*	Sparassis root rot
	Populus spp. (poplar)	
152	*Armillaria mellea*	Shoestring root rot
153	*Ciborinia whetzelii*	Ink spot
154	*Cytispora chrysosperma*	Cytispora canker
155	*Dothichiza populea*	Dothichiza canker
156	*Fomes applanatus*	White butt rot
157	*F. fomentarius*	White mottled rot
158	*F. igniarius*	White heartrot
159	*Fusicladium radiosum*	Shoot blight
160	*Hypoxylon pruinatum*	Hypoxylon canker
161	*Linospora tetraspora*	Leaf blight
162	*Marssonina populi*	Leaf spot, shoot blight
163	*Melampsora bigelowii, M. medusae, M. occidentalis*	Leaf spot
164	*Nectria galligena*	Nectria canker
165	*Neofabraea populi*	Neofabraea canker
166	*Sclerotina bifrons*	Ink spot
167	*Septoria musiva*	Septoria canker
168	*S. populicola*	Leaf spot
169	*Taphrina aurea*	Yellow leaf blister
170	*T. johansonii*	Catkin blister
171	*Trametes suaveolens*	Soft white rot
172	*Uncinula salicis*	Powdery mildew
173	*Valsa nivea, V. sordida*	Valsa canker
174	*Xylaria digitata*	Xylaria root rot
	Quercus spp. (oak)	
175	*Aleurodiscus oaksii*	Smooth patch
176	*Armillaria mellea*	Shoestring root rot
177	*Cronartium cerebrum*	Globose gall rust
178	*C. fusiforme*	Southern fusiform rust
179	*C. strobilinum*	Pinecone rust
180	*Daedalea quercina*	Brown cubical rot
181	*Endoconidiophora fagacearum*	Oak wilt
182	*Fistulina hepatica*	Brown cubical rot
183	*Fomes everhartii*	White heartrot
184	*Gnomonia veneta*	Anthracnose
185	*Hydnum erinaceus*	White rot
186	*Morenoella quercina*	Leaf spot
187	*Polyporus berkeleyi*	White butt rot
188	*P. croeceus*	White pocket rot
189	*P. dryophilus*	Piped rot
190	*P. frondosus*	Butt rot
191	*P. hispidus*	Heartrot, canker
192	*P. spraguei*	White rot
193	*P. sulphureus*	Brown cubical rot
194	*Sphaeropsis quercina*	Sphaeropsis canker
195	*Sphaerotheca lanestris*	Witches'-broom
196	*Stereum gausapatum*	White mottled rot

/1/ Hardwood. /2/ Softwood. /3/ Data also apply to other softwood pines: *P. lambertiana* (sugar pine), *P. monticola* (western white pine).

138. MISTLETOE PARASITES: FOREST TREES

In forest trees, witches'-broom is the chief disease caused by mistletoe.

	Host (Common Name)	Parasite (Common Name)
	(A)	(B)
1	*Abies* spp. (fir)	*Phoradendron pauciflorum* (western fir mistletoe)[1]
2	*Abies anabilis* (Cascade fir), *A. concolor* (white fir), *A. grandis* (grand fir), *A. lasiocarpa* (alpine fir), *A. lasiocarpa arizonica* (cork-bark fir)	*Arceuthobium campylopodum abietinum* (western dwarf mistletoe)
3	*Acer* spp. (maple)	*Phoradendron flavescens* (American mistletoe)
4	*Alnus* spp. (alder)	*Phoradendron macrophyllum* (big-leaf mistoe)
5	*Cupressus* spp. (cypress)	*Phoradendron densum* (cypress mistletoe)
6	*Fraxinus* spp. (ash)	*Phoradendron longispicum* (long-spiked mistletoe)

/1/ Leader injury.

138. MISTLETOE PARASITES: FOREST TREES

	Host (Common Name)	Parasite (Common Name)
	(A)	(B)
7	*Fraxinus* spp. (ash)	*Phoradendron macrophyllum* (big-leaf mistletoe)
8	*Juglans* spp. (walnut)	*Phoradendron longispicum* (long-spiked mistletoe)
9		*P. macrophyllum* (big-leaf mistletoe)
10	*Juniperus* spp. (juniper)	*Phoradendron densum* (cypress mistletoe)
11		*P. juniperinum* (juniper mistletoe)
12		*P. ligatum* (pinch-scale mistletoe)
13	*Larix laricina* (eastern larch)	*Arceuthobium pusillum* (dwarf mistletoe)
14	*Larix lyalli* (alpine larch), *L. occidentalis* (western larch)	*Arceuthobium campylopodum laricis* (western dwarf mistletoe)
15	*Picea breweriana* (Brewer spruce), *P. engelmanni* (Engelmann spruce), *P. pungens* (Colorado spruce)	*Arceuthobium campylopodum microcarpum* (western dwarf mistletoe)
16	*Picea glauca* (white spruce)[a], *P. mariana* (black spruce), *P. rubens* (red spruce)[a]	*Arceuthobium pusillum* (dwarf mistletoe)
17	*Pinus albicaulis* (whitebark pine), *P. aristata* (bristlecone pine), *P. balfouriana* (foxtail pine), *P. flexilis* (limber pine)	*Arceuthobium campylopodum cyanocarpum* (western dwarf mistletoe)
18	*Pinus attenuata* (knobcone pine)[a], *P. contorta latifolia* (lodgepole pine)[a], *P. coulteri* (Coulter pine), *P. jeffreyi* (Jeffrey pine), *P. ponderosa* (western yellow pine), *P. radiata* (Monterey pine), *P. sabinana* (digger pine)	*Arceuthobium campylopodum typicum* (western dwarf mistletoe)
19	*Pinus cembroides* (Mexican piñon pine) and other piñons	*Arceuthobium campylopodum divaricatum* (piñon mistletoe)
20	*Pinus contorta latifolia* (lodgepole pine)	*Arceuthobium americanum* (lodgepole pine dwarf mistletoe)
21	*Pinus lambertiana* (sugar pine), *P. monticola* (western white pine), *P. reflexa* (Mexican white pine)	*Arceuthobium campylopodum blumeri* (western dwarf mistletoe)
22	*Pinus latifolia* (Apache pine), *P. leiophylla chihuahuana* (chihuahua pine), *P. ponderosa arizonica* (Arizona ponderosa pine)	*Arceuthobium vaginatum* (southwestern dwarf mistletoe)
23	*Pinus ponderosa scopulorum* (Rocky Mountain ponderosa pine)	*Arceuthobium vaginatum cryptopodum* (Rocky Mountain ponderosa pine mistletoe)
24	*Populus* spp. (poplar)	*Phoradendron longispicum* (long-spiked mistletoe)
25		*P. macrophyllum* (big-leaf mistletoe)
26	*Quercus* spp. (oak)	*Phoradendron engelmanni* (Texas mistletoe)
27		*P. flavescens* (American mistletoe)
28		*P. longispicum* (long-spiked mistletoe)
29		*P. villosum* (Pacific mistletoe)
30	*Salix* spp. (willow)	*Phoradendron longispicum* (long-spiked mistletoe)
31		*P. macrophyllum* (big-leaf mistletoe)
32	*Tsuga heterophylla* (western hemlock), *T. mertensiana* (mountain hemlock)	*Arceuthobium campylopodum tsugensis* (western dwarf mistletoe)
33	*Ulmus* spp. (elm)	*Phoradendron engelmanni* (Texas mistletoe)
34		*P. flavescens* (American mistletoe)

/a/ Rarely serves as host.

	Species	Disease	Natural Occurrence in Animals Other than Man	Microscopic Appearance in Man Skin
	(A)	(B)	(C)	(D)
1	*Cladosporium werneckii*	Tinea nigra	None	Pigmented (light brown to dark green), branching, septate hyphae; may develop closely septate swollen cells and chlamydospores
2	*Epidermophyton flocossum*	Tinea pedis, T. cruris, T. unguium	None	Abundant-branching, septate hyphae; may segment into chains of arthrospores
3	*Malassezia furfur*	Tinea versicolor	None	Clusters of spherical, thick-walled, budding cells, 3-8 μ, and short irregular hyphae
4	*Microsporum audouinii*	Tinea capitis, T. corporis	Dog (rare), monkey (rare)	Branching, septate hyphae; may segment into chains of arthrospores
5	*M. canis*	Tinea capitis, T. corporis, T. barbae, T. unguium	Cat[1], chinchilla, dog[1], horse, monkey	Branching, septate hyphae; may segment into chains of arthrospores
6	*M. distortum*	Tinea capitis, T. corporis	Dog, monkey[1]	Branching, septate hyphae; may segment into chains of arthrospores
7	*M. gypseum*[2]	Tinea capitis, T. corporis	Cat, dog[1], horse[1], monkey, mouse, rat	Branching, septate hyphae; may segment into chains of arthrospores
8	*M. nanum*	Tinea capitis, T. corporis	Swine	Branching, septate hyphae; may segment into chains of arthrospores
9	*M. vanbreuseghemii*	Tinea capitis	Dog, Malabar squirrel	Branching, septate hyphae; may segment into chains of arthrospores
10	*Piedraia hortai*	Black piedra	Primates	None
11	*Trichophyton concentricum*	Tinea imbricata	None	Abundant-branching, septate hyphae; may segment into chains of arthrospores
12	*T. ferrugineum*	Tinea capitis, T. corporis	None	Branching, septate hyphae; may segment into chains of arthrospores
13	*T. gallinae*	Tinea capitis, T. corporis	Dog, poultry[1], wild birds	Branching, septate hyphae (rare)
14	*T. megninii*	Tinea barbae, T. capitis, T. unguium, T. corporis	Cattle?	Branching, septate hyphae
15	*T. mentagrophytes*	Tinea pedis, T. cruris, T. corporis, T. capitis, T. unguium, T. barbae	Many domestic and wild animals	Branching, septate hyphae; may segment into chains of arthrospores
16	*T. rubrum*	Tinea pedis, T. unguium, T. cruris, T. corporis, T. barbae, T. capitis	Cattle (rare), dog (rare)	Branching, septate hyphae; may segment into chains of arthrospores
17	*T. schoenleinii*	Favus, Tinea capitis, T. corporis, T. unguium	Dog (rare)	Abundant hyphae; may segment into chains of arthrospores throughout cellular debris of scutulum
18	*T. tonsurans*	Tinea capitis, T. corporis, T. unguium	None	Branching, septate hyphae; may segment into chains of arthrospores
19	*T. verrucosum*	Tinea corporis, T. capitis, T. barbae	Cattle[1], dog (rare), donkey, goat, horse, sheep	Branching, septate hyphae; may segment into chains of arthrospores

/1/ The more common hosts. /2/ A common saprophyte in soil.

Microscopic Appearance in Man: Nail (E)	Microscopic Appearance in Man: Hair (F)	Microscopic Appearance of Culture on Sabouraud's Agar (G)	
None	None	Pigmented hyphae produce blastopores laterally, and 1-3 septate conidia in clusters or in short chains from apiculi or short conidiophores	1
Branching, septate hyphae; may segment into chains of arthrospores	None	Macroconidia abundant, clavate, 2-6 cells, blunt-tipped, smooth thin walls; occur in clusters of 2 or 3; no microconidia; abundant chlamydospores	2
None	None	No culture method available	3
None	Ectothrix; sheath of small spores, 2-3 μ	Hyphae with chlamydospores; microconidia infrequent, clavate, 2.5-4 x 3-6 μ; macroconidia rare, rudimentary, ill-formed	4
Rare	Ectothrix; sheath of small spores, 2-3 μ	Macroconidia numerous, 8-15 cells, spindle-shaped, thick rough walls, 8-15 x 40-150 μ; microconidia few, clavate, 2-4 x 3-6 μ	5
None	Ectothrix; sheath of small arthrospores, 2-3 μ	Macroconidia numerous, rough thick walls, distorted in shape, 4-14 x 3-40 μ; microconidia numerous, pyriform, 2-4 x 3-6 μ	6
None	May be sheath of small arthrospores, 2-3 μ; more commonly large-spored ectothrix, 5-8 μ; invasion frequently limited to hyphae inside hair	Macroconidia numerous, 4-6 cells, ellipsoid; thin rough walls, 8-12 x 30-50 μ; microconidia few, clavate	7
None	Septate and nonseptate hyphae, air bubbles inside hair	Macroconidia numerous, 2-3 cells, pyriform-to-elliptical, thin walls, finely echinulate or smooth, 5-7 x 12-18 μ; microconidia few	8
None	Closely septate hyphae inside hair	Macroconidia numerous, 7-10 cells, cylindro-fusiform, thick walls, densely echinulate, 10 x 60 μ; microconidia few to abundant, pyriform-to-obovate, 4 x 9 μ	9
None	Nodule on hair shaft consists of brown, dichotomously branched, closely septate hyphae, 4-8 μ diameter, and asci containing 2-8 ascospores	Dark, thick-walled, closely septate hyphae, chlamydospores	10
None	None	Branching, septate, irregular hyphae, with chlamydospores, pectinate hyphae, favic chandeliers	11
None	Ectothrix; sheath of small arthrospores, 2-3 μ	Mycelium with occasional hyphal swellings; arthrospores, chlamydospores	12
None	Ectothrix; chains of large spores, 4-8 μ	Macroconidia usually numerous, 2-10 cells, clavate, smooth and slightly thickened walls; microconidia few, small, pyriform-to-elongate	13
Branching, septate hyphae; may segment into chains of arthrospores	Ectothrix; chains of large spherical arthrospores, 6-8 μ	Microconidia numerous, small pyriform to elongate; macroconidia rare, 2-8 cells, slightly clavate	14
Branching, septate hyphae; may segment into chains of arthrospores	Ectothrix; chains of small arthrospores, 3-5 μ	Microconidia numerous, subspherical-to-pyriform, in terminal clusters or singly along hyphae; macroconidia clavate, 2-5 cells, thick walls, 4-6 x 10-50 μ	15
Branching, septate hyphae; may segment into chains of arthrospores	Ectothrix; chains of large arthrospores, approximately 5 μ	Microconidia numerous, singly along hyphae and in clusters; macroconidia infrequent, pencil-shaped thin walls, 4-6 x 10-50 μ	16
Branching, septate hyphae; may segment into chains of arthrospores	Endothrix; hyphae, occasional arthrospore, and numerous air bubbles inside hair	Irregular hyphae, chlamydospores, hyphal swellings, pectinate hyphae, favic chandeliers	17
Rare	Endothrix; large spores in chains, 4-7.5 μ	Microconidia numerous, clavate along sides of hyphae or on short conidiophores; spore-bearing hyphae stain poorly with Lacto-Phenol Cotton Blue; numerous chlamydospores; thin, smooth-walled macroconidia rare	18
None	Ectothrix; chains of large arthrospores, 5-10 μ	Irregular hyphae, abundant chlamydospores; best growth at 37°C	19

MYCOSES

Susceptible Laboratory Animals[1]	Microscopic Appearance			
	In Human Tissue	Of Culture at 25°C	Of Culture at 37°C	
(G)	(H)	(I)	(J)	
Diabetic rabbit and rat	Nonseptate, coenocytic hyphae, 6-15 μ in width	Broad, coenocytic mycelium with sporangiophores	Similar to growth at 25°C	1
Hamster, mouse	Granules of filamentous, branching, gram-positive hyphae, 1 μ or less in width; club-shaped accretions on tips of hyphae may be present	Grows slowly	Microaerophilic-to-anaerobic, filamentous, branching, gram-positive hyphae, 1 μ or less in width; organism grows only on enriched media[3]	2
Mouse *(A. boydii)*	Oval, irregular-shaped granules, 0.5-2 mm, made up of segmented, branched, hyaline or brown hyphae, 2-5 μ diameter, and chlamydospores	*A. boydii:* mycelium with oval-to-pyriform conidia, 5-7 x 8-10 μ, borne singly at ends of long conidiophores; dark brown, thin-walled perithecia, 50-200 μ diameter, containing evanescent asci and elliptical ascospores; coremia occasionally present	Similar to cultures at 25°C	3
Birds, guinea pig, rabbit	Branching, septate hyphae	Conidiophore forms vesicle at tip; surface covered with sterigmata bearing long chains of conidia	Similar to growth at 25°C	4
Guinea pig, mouse	Single-budding, thick-walled cells, 8-15 μ	Mycelium with oval-to-pyriform conidia, 3-5 μ, on conidiophores or attached directly to hyphae	Similar to forms observed in tissue	5
Guinea pig, mouse, rabbit, rat	Oval-to-spherical budding cells, 2-4 μ; frequently hyphae which may show clusters of blastospores attached at septations	Oval-to-spherical, single-budding cells, 2-4 μ; pseudohyphae and hyphae; clusters of budding cells often at septations; thick-walled chlamydospores, 6-9 μ, on special medium	Similar to growth at 25°C	6
Guinea pig, hamster, mouse, other rodents	Thick-walled spherules, 20-60 μ, containing endospores, 2-5 μ	Mycelium with arthrospores, 2.5-3 x 3-4 μ, alternating with empty cells	Similar to growth at 25°C; under special conditions with special media, tissue spherules obtained in vitro	7

as beef heart infusion agar at pH 6.8-7.5.

MYCOSES

Susceptible Laboratory Animals[1]	Microscopic Appearance			
	In Human Tissue	Of Culture at 25°C	Of Culture at 37°C	
(G)	(H)	(I)	(J)	
Mouse, rat	Spherical, single-budding, thick-walled cells, 5-20 μ, surrounded by wide gelatinous capsule	Similar to cells seen in tissue[3]; abortive hyphae may be seen on primary isolation	Similar to cells seen in tissue	8
None	Oblong-to-rectangular cells with somewhat rounded ends, 4-8 μ	Mycelium segments into rectangular arthrospores; germ tube forms at corners	Similar to growth at 25°C	9
Guinea pig, hamster, mouse	Intracellular, oval, budding cells, 1-5 μ	Delicate mycelium with thin-walled, sub-spherical-to-pyriform conidia, 2-5 μ, and thick-walled, tuberculated conidia, 8-20 μ	Budding cells, 1-5 μ; must be grown on enriched medium	10
Guinea pig, hamster, mouse	Intracellular, ovoid, budding cells, 7 x 15 μ (occasionally up to 80 μ); walls 1-2 μ thick; fat droplets	Identical to above	Budding cells, 5-15 μ	11
Guinea pig, mouse	Delicate, branched, gram-positive hyphae, 0.5-1 μ diameter; partially acid-fast	Branching hyphae, 0.5-1 μ diameter, break up readily into bacillary or coccoid forms	Similar to cultures at 25°C	12
Guinea pig, mouse	Granules of gram-positive, branching hyphae, 0.5-1 μ diameter	Branching hyphae, 0.5-1 μ diameter; spherical conidia, 0.5-1 μ, sparse to absent	Similar to cultures at 25°C	13
Guinea pig, hamster, mouse	Multiple-budding, thick-walled cells, 10-60 μ	Mycelium with rare oval conidia, 3-5 μ	Similar to forms observed in tissue	14
Mouse, rat	Single or clustered spherical, thick-walled, dark brown cells, 6-12 μ, multiply by splitting, not budding	Three types of sporulation: *Phialophora*--conidia borne within a terminal cuplike structure on a flask-shaped conidiophore; *Cladosporium*--conidia in branching chains arising terminally from conidiophore; *Acrotheca*--conidia borne acropleurogenously on swollen, clublike conidiophore	Similar to cultures at 25°C	15
None	Thick-walled spherule, 50-350 μ, with pore, containing up to 16,000 endospores, 7-9 μ	No culture method available	No culture method available	16
Hamster, mouse, rat	Rarely seen without special stains; gram-positive, cigar-shaped or spherical-to-oval, usually intracellular, budding cells, 3-5 μ; asteroid forms rare	Delicate hyphae, 2 μ in width, pyriform-to-spherical conidia, 2-4 x 2-6 μ, borne in clusters on lateral branches or laterally along hyphae	Cigar-shaped, spherical or oval budding cells; must be grown on enriched medium	17

true of some strains which may be weakly encapsulated in vitro, giving culture a different gross appearance

	Diphasic	
1	**Slant:** Coagulated whole egg. **Overlay:** Locke's, Ringer's or saline solution, alone or with one or more of the following: serum, egg white, rice (starch, flour, or powder).	*Dientamoeba fragilis* [24][2], [14][3]; *Endolimax nana* [11,24][2]; *Entamoeba aulostomi* [13][2]; *E. coli* [17][2], [23][4]; *E. gingivalis* [12][2]; *E. histolytica* [5, 11][2], [6][3]; *E. invadens* [15][2]; *Iodamoeba buetschlii* [24][2]
2	**Slant:** Coagulated serum. **Overlay:** Ringer's or saline solution with serum, egg white and rice.	*Endolimax nana, Entamoeba coli, E. gingivalis, E. histolytica* [11][2]; *E. invadens* [16][2]; *E. muris* [21][2]
3	**Slant:** Liver infusion agar. **Overlay:** Saline with serum and rice.	*Entamoeba histolytica* [7][2], [8][3]; *E. invadens* [22][2]
	Liquid	
4	Locke's, Ringer's, or saline solution with serum and rice.	*Endamoeba thomsoni* [27][2]; *Entamoeba barreti* [3][2]; *E. invadens* [22][2]; *E. ranarum* [4][2]
5	Egg infusion, rice starch, with or without liver extract.	*Dientamoeba fragilis* [2][2]; *Entamoeba coli* [2][2]; *E. histolytica* [1][2]; *E. invadens* [15, 18][2]; *E. terrapini* [18][2]
6	Fluid thioglycollate broth with serum[5].	*Entamoeba coli, E. histolytica* [25][3]
	Protozoa[1]	
7	Trypticase-dextrose broth with serum[6].	*Entamoeba histolytica* [20][3]; *E. invadens, E. terrapini* [9][3]
	Tissue[1]	
8	Saline, tissue slice.	*Entamoeba invadens* [19]
9	Hank's salt solution with serum and chick embryo (minced or sliced).	*Entamoeba histolytica* [26]
	Axenic Culture[7]	
	Diphasic	
10	**Slant:** Tryptose, trypticase, yeast extract agar with serum. **Overlay:** Tryptose, trypticase, yeast extract broth with cell-free chick embryo extracts and vitamins.	*Entamoeba histolytica* [10]
	Liquid	
11	Trypticase, yeast extract, maltose broth with serum.	*Entamoeba invadens, E. terrapini* [9]

/1/ Growth occurs in presence of one or more types of metabolizing cell: bacteria, protozoa, or metazoa. /2/ Xenic growth (unknown number of associates present in culture). /3/ Monoxenic growth (one associate present). /4/ Dixenic growth (two associates present). /5/ Preconditioned with a streptobacillus. /6/ Preconditioned with *Trypanosoma cruzi*. /7/ Growth occurs in absence of any other metabolizing cell.

Part II. TRICHOMONADIDAE

	Medium (A)	Species Showing Growth[1] (B)
	Agnotobiotic Culture[2]	
1	Egg-yolk infusion: Medium, with or without liver extract, with rice starch, 1-10% serum enrichment. For preparation, consult reference 3.	Most species can be isolated and maintained in the presence of balanced contaminants.[3]
	Axenic Culture[4]	
2	Diamond's [6]: 2% trypticase, 1% yeast extract, 0.5% maltose, 0.1% L-cysteine HCl, 0.02% L-ascorbic acid, 0.08% KH_2PO_4, 0.08% K_2HPO_4, 0.05-0.10% agar, 10% inactivated sterile horse or sheep serum. Adjust to pH 6-8 with KOH, NaOH, or HCl (base or acid depends on species). Use with antibiotics for axenic isolation or retardation of bacterial growth. Autoclave 9 ml of medium 15 minutes at 15-lb pressure; add serum and antibiotics aseptically after medium has cooled. Use as soon as possible. Shelf-life 30 days at 4°C.	*Hypotrichomonas acosta*, *Monocercomonas* sp. (NS-1:PRR), *M. colubrorum*, *Trichomitis batrachorum*, *Tritrichomonas augusta* [24]; *Pentatrichomonas hominis*, *Tetratrichomonas gallinarum*, *Trichomonas gallinae*, *T. vaginalis*, *Tritrichomonas eberthi* [6]; *Tetratrichomonas buttreyi* [6, 9, 15]; *Trichomonas rotunda* [15]; *Tritrichomonas enteris* [1]; *T. foetus* [9]; *T. suis* [6, 15]
3	CPLM [21]: 3.0% bacto peptone, 0.1% agar, 0.2% cysteine HCl, 0.16% maltose, 20 ml/100 liver infusion, 65 ml/100 Ringer's solution, 10% sterile serum. Prepare as above. 0.002% methylene blue may be added as an indicator. 0.1% Wilson's gastric mucin 1701X stimulatory for *Trichomitis batrachorum* and *Tetratrichomonas prowazeki*.	*Hypotrichomonas acosta*, *Tritrichomonas augusta* [23]; *Pentatrichomonas hominis* [4, 41]; *Tetratrichomonas buttreyi*, *Trichomonas rotunda*, *Tritrichomonas suis* [15]; *Tetratrichomonas prowazeki* [17]; *Trichomitis batrachorum* [17]; *Trichomonas gallinae* [18]; *T. vaginalis* [21, 47]; *Tritrichomonas enteris* [1]; *T. foetus* [10]
4	B.B.L.[5] fluid thioglycollate[6]: With 5-10% sterile serum.	*Hypotrichomonas acosta* [23]; *Pentatrichomonas hominis*, *Trichomonas vaginalis* [5]; *Tetratrichomonas prowazeki* [17]; *Trichomonas gallinae* [18]
5	STS [22]: 2% trypticase, 0.15% cysteine HCl, 0.1% maltose, 0.1% agar, 5% sterile serum.	*Trichomonas vaginalis* [22]; *Tritrichomonas augusta* [34]
6	BMH [24]: 0.5% glucose, 1.0% trypticase, 0.25% yeast extract, 0.01% KH_2PO_4, 0.25% NA_2 glycerophosphate·5 H_2O, 0.004% Ca pantothenate, 0.005% cholesterol, 0.0001% TEM 4T, 0.1% agar, 0.04% ascorbic acid, 0.05% thiomalic acid, 0.004% trace-metals mixture #50, 1.0 ml/100 vitamin mixture #12. Grow newly inoculated cultures for 2 days at 25°C, then place at 15°C for 1-2 months.	*Hypotrichomonas acosta*, *Monocercomonas* sp. (NS-1:PRR), *M. colubrorum*, *Trichomitis batrachorum*, *Tritrichomonas augusta* [24]

/1/ Species isolated from homeotherms: *Pentatrichomonas hominis*, *Tetratrichomonas buttreyi*, *T. gallinarum*, *Trichomonas gallinae*, *T. tenax*, *T. vaginalis*, *Tritrichomonas eberthi*, *T. enteris*, *T. foetus*, *T. suis*. Species isolated from poikilotherms: *Hypotrichomonas acosta*, *Monocercomonas* sp. (NS-1:PRR), *M. colubrorum*, *Tetratrichomonas prowazeki*, *Trichomitis batrachorum*, *Tritrichomonas augusta*. /2/ Many media for parasitic amoeba also support agnotobiotic trichomonad cultures [44, 45] (*see* Part I). /3/ The following have been cultured agnotobiotically (in the presence of unknown other organisms): *Metatrichomonas termopsidis*, *Monocercomonas verrens*, *Tetratrichomonas limacis*, *T. microti*, *T. ovis*, *Trichomitis marmotae*. /4/ Because these media support high bacterial populations, antibiotics are necessary to retard bacterial overgrowth or for axenic isolation. The following antibiotic combinations have been successful for axenic isolation: 10,000 units/ml Na or K penicillin, 1,000 µg/ml streptomycin [6]; 2,000 µg/ml dehydrostreptomycin, 250 µg/ml chloroamphenicol, 60 µg/ml polymyxin B [23, 24]; for molds and yeasts, 300 µg/ml nystatin [16]; *see also* references 17, 38. /5/ Baltimore Biological Laboratory, Baltimore 18, Md. /6/ Or without indicator, Brewer-modified.

140. CULTURE MEDIA: PROTOZOA

Part III. TRYPANOSOMATIDAE

	Medium	Species Showing Growth[1]
	(A)	(B)
	Blood Agar[2-5]	
1	**Solid phase**: 14 g agar, 6 g NaCl, 450 ml defibrinated rabbit blood, 900 ml distilled H_2O. For variation, consult reference 20.	*Leishmania enrietti* [4]; *L. donovani*, *L. tropica* [27]; *L. tarentolae* [42]; *Trypanosoma ambystomae* [16]; *T. brucei*, *T. lewisi* [20]; *T. cruzi*, *T. duttoni*, *T. melophagium*, *T. rotatorium*, *T. theileri*, 2 species of bird trypanosomes [30]; *T. striati* [32]
2	**Solid phase**: 10-15 g agar, 10 g glucose, 1,000 ml horse meat broth, 1,000 ml defibrinated horse blood.	*Crithidia melophagia*, *Leptomonas ctenocephali*, *L. fasciculata*, *Trypanosoma cruzi*, *T. rotatorium*, *T. syrnii*, *T. theileri* [28]; *Leishmania braziliensis* [33]; *L. donovani* [28, 33]; *L. tropica* [22, 33]; *Strigomonas oncopelti* [22]; *Trypanosoma conorhini* [7]
3	**Solid phase**: 50 g bacto beef, 20 g neopeptone, 5 g NaCl, 20 g bacto agar, 100-150 ml defibrinated human or rabbit blood. Variation: With Locke's solution overlay [14, 39][6].	*Leishmania braziliensis*, *L. donovani*, *L. tropica*, *Trypanosoma conorhini*, *T. lewisi*, *T. pipistrelli* [39]; *T. cruzi* [36, 39]; *T. rangeli* [38]
4	**Solid phase**: 31 g nutrient agar, 5 g plain agar, 167 ml inactivated human plasma, 167 ml washed human red cells.	*Trypanosoma gambiense*, *T. rhodesiense* [46]
5	**Solid phase**: 20 g agar, 5 g dextrose, 7 g NaCl, 20 g proteose peptone, 100 ml defibrinated rabbit blood. **Liquid phase**: Infusion broth containing 2% proteose peptone and 0.5% dextrose. For variation, consult reference 9.	*Trypanosoma cruzi* [6, 9]; *T. lewisi*, bird trypanosomes, frog trypanosomes [9]
6	**Solid phase**: 3 g bacto beef, 5 g bacto peptone, 8 g NaCl, 15 g bacto agar, 333 ml citrated human or rabbit blood. **Liquid phase**: Locke's solution.	*Trypanosoma congolense* [37]; *T. gambiense*, *T. rhodesiense* [41]
	Semi-Solid[3,4,7]	
7	1 part 3% agar, 8 parts Locke's solution with 0.2% glucose, 1 part rabbit serum.	*Herpetomonas muscidarum*, *Leishmania agamae*, *L. ceramodactyli*, *L. donovani*, *L. tarentolae*, *L. tropica*, *Strigomonas oncopelti*, *Trypanosoma cruzi*, *T. ptyodactyli*, *T. rabinowitschi* [1]
8	3 g agar, 150 ml defibrinated rabbit blood, 1,000 ml normal saline.	*Leishmania donovani*, *L. tropica* [19]
9	Mixture of 21 amino acids, 3 salts, 10 vitamins, glucose, guanosine, adenine SO_4, uracil, uric acid, urea, creatine, creatinine, nucleic acid, 0.2% agar, heat-coagulated red blood cells.	*Trypanosoma cruzi* [17]
	Liquid[3,4,7]	
10	0.5 ml human or monkey blood, 0.5 ml 2% sodium citrate in 0.85% NaCl solution, 1 ml Ringer's solution (with 0.6% NaCl). For variation, consult reference 3.	*Trypanosoma brucei* [3]; *T. congolense*, *T. gambiense* [3, 34]; *T. cruzi* [34]
11	Overlay from item 3 for trypanosomes of the *lewisi* group and from item 6 for African trypanosomes.	*Trypanosoma congolense* [45]; *T. cruzi* [44]; *T. gambiense*, *T. rhodesiense* [41]
12	10 ml 5% lactoalbumin hydrolysate in Earle's saline, 5 ml filtered and unheated calf serum, 5 ml red cell lysate, 100 ml 0.1% glucose in Earle's saline.	*Trypanosoma gambiense* [26]
	Dialysate[3,7]	
13	Cellophane loop filled with Locke's solution suspended in tubes of diphasic blood agar. Variation: Loop suspended in blood-coagulum-peptone medium [10].	*Trypanosoma cruzi* [10, 40]
	Defined and Partially Defined[3,4,7]	
14	Mixture of amino acids, salts (including trace metals), glucose, purines, pyrimidines, vitamins, growth factors, and hemin. Variation: Only methionine as amino acid and no hemin [25].	*Herpetomonas culicidarum* [5]; *Leishmania tarentolae* [42]; *Strigomonas oncopelti* [25]

/1/ Use of the generic names ***Crithidia***, ***Herpetomonas***, ***Leptomonas***, and ***Strigomonas*** is not yet uniform. /2/ Test-tube cultures usually contain 5 ml base; flask or plate cultures contain varying amounts of base, depending on size of container. /3/ Cultures usually maintained at 22°-25°C. /4/ Ingredients are given in amounts to be added to one liter of distilled water, unless otherwise specified. /5/ Diphasic test-tube cultures receive 2-3 ml overlay; flask cultures approximately 15 ml for each 25 ml base. /6/ 10% blood for ***Trypanosoma cruzi*** and ***Leishmania*** spp.; 30% for other species and all isolations. /7/ Varying amounts of media are used, depending on size of container.

continued

140. CULTURE MEDIA: PROTOZOA

Part III. TRYPANOSOMATIDAE

	Medium (A)	Species Showing Growth (B)
	Defined and Partially Defined[3,4,7]	
15	Item 9 without agar.	*Trypanosoma cruzi* [17]
16	15 g bacto tryptose, 2 g glucose, 1 mg thiamine, 3 mg folic acid, 20 mg hemin, 25 mg sodium stearate, 4 g NaCl, 5 g $Na_3PO_4 \cdot 12H_2O$, 0.4 g KCl, 1,000 ml twice-distilled H_2O.	*Trypanosoma cruzi* [2]
	Avian Embryo[8]	
17	Chorioallantoic membrane.	*Leishmania donovani, Trypanosoma gambiense* [35]; *Leishmania tropica* [29]; *Trypanosoma brucei, T. evansi* [18, 35]; *T. cruzi* [11, 31]; *T. equiperdum, T. rhodesiense* [18]
18	Intra-yolk sac.	*Leishmania braziliensis, L. donovani, L. tropica* [15]; *Trypanosoma brucei, T. equiperdum, T. evansi* [23]; *T. cruzi* [21]
	Tissue Culture[9]	
19	Mammalian tissues in nutrient fluid.	*Leishmania donovani* [13]; *Trypanosoma conorhini* [7]; *T. cruzi* [12, 31]; *T. gambiense, T. rhodesiense* [8]
20	Avian tissues in nutrient fluid.	*Trypanosoma cruzi* [24]
21	Insect tissues in nutrient fluid.	*Trypanosoma brucei, T. congolense, T. vivax* [43]

/3/ Cultures usually maintained at 22°-25°C. /4/ Ingredients are given in amounts to be added to one liter of distilled water, unless otherwise specified. /7/ Varying amounts of media are used, depending on size of container. /8/ Cultures usually maintained at 25°-35°C. /9/ Cultures usually maintained at 25°-38°C.

141. CULTURE MEDIA: ANIMAL TISSUES

Part I. BALANCED SALT SOLUTIONS

In general, these diluents are used only in combination with naturally occurring body substances (e.g., blood serum, tissue extracts), and/or with more complex, chemically defined, feeding solutions. pH of the final medium must be regulated. Inclusion of the names of commercial suppliers in no way implies endorsement by the Federation of American Societies for Experimental Biology.

Part III. ALGAE

Variations of Pringsheim's soil-water medium are for nonsterile cultures, especially for isolation purposes and for growing algae to secure "normal" growth forms. Success with soil-water media depends on the selection of a suitable garden soil. This soil should be of medium humus content and should not have been recently fertilized with commercial fertilizers. Soils with a high clay content are usually not the most suitable for most organisms.
A variety of soil-water media can be made using a basic formula to which are added additional materials. The basic soil-water medium is made by placing one-quarter to one-half inch of garden soil in the bottom of a test tube, then adding pyrex-distilled water until the tube is three-quarters full. The tube is then plugged with cotton and steamed (not autoclaved) for one hour on two consecutive days. A few algae such as *Spirogyra* grow well in this basic medium. For most presumably phototrophic algae which thrive in an alkaline medium, a small pinch of powdered $CaCO_3$ is placed in the bottom of the test tube before the soil and water are added.
Some algae (*Astasia, Euglena, Polytoma, Polytomella, Pyrobotrys,* and others) require additional complex nitrogenous or carbon compounds not present in the basic formula. In the case of *Euglena* and *Pyrobotrys*, the best results have been obtained by adding one-quarter of a garden pea cotyledon to the basic medium (including $CaCO_3$) before steaming. For the colorless forms, the addition of a barley grain before steaming supplies the necessary carbon source. A few strains, such as *Botryococcus*, grow best when a pinch of sterile ammonium magnesium phosphate is added after the steaming of the basic medium (including $CaCO_3$). [3]

144. NATURAL SEA WATER

Part I. GENERAL CHARACTERISTICS, SALINITY, AND CONSTITUENTS

Values are per kilogram of sea water, unless otherwise specified.

	Specification	Value
	(A)	(B)
	General Characteristics	
1	Density	1.02-1.03
2	Temperature	-1.5 to +30°C
3	pH, surface water	8.1-8.3
4	pH, at depth	7.5-8.1
5	Freezing point[1]	-2°C
6	Specific heat[2]	0.955 cal/g
7	Velocity of sound	1,450-1,550 m/sec
8	Transparency, maximum[3]	66 m
9	Hydrostatic pressure[4]	1 atm/10 m
	Salinity	
10	All oceans, average	33-37 g
11	Below 1,000 m (-0.5 to +5°C)	34.6-35.0 g
12	At equator	35 g
13	20th-40th parallel, N. latitude	35.5 g
14	10th-30th parallel, S. latitude	35.5 g
15	Average, 60° N. and S. latitudes to Poles	35 g
16	North Pacific	34.5 g
17	North Sea, off Denmark	34 g
18	Indian Ocean, near Australia	35.5 g
19	South Pacific, off Peru	35.5 g
20	Arabian Sea	36-37 g
21	Sargasso Sea, N. Atlantic	36.5-37.0 g
22	South Atlantic, off Brazil	36-37 g
23	Red Sea (surface)	38-41 g
24	Mediterranean Sea (surface)	37-39 g
25	Gulf of Mexico (surface)	36-37 g
26	Antarctic Ocean (surface)	34.0-34.6 g
27	Arctic Ocean (surface)	32-33 g
	Constituents[5]	
28	Aluminum	0.5 mg
29	Argon[6]	0.4-0.7 mg
30	Arsenic	10-20 µg
31	Barium	54 µg
32	Bicarbonate	0.14 g
33	Bismuth	0.2 µg

Part III. RELATION OF CHLORINITY AND SALINITY TO DENSITY

Chlorinity is defined as the amount, in grams, of precipitated halides (chlorine, bromine, and iodine), as determined by precipitation with a silver salt, in one kilogram of salt water. Salinity is defined as the total weight, in grams, of dissolved solids in one kilogram of sea water, when all carbonate has been converted to oxide, the bromine and iodine replaced by chlorine, and all organic matter completely oxidized. The standard chlorinity of sea water is 19, and equals a salinity of 34.325 (salinity = 0.03 + 1.805 x chlorinity).

	Chlorinity g/kg	Salinity g/kg	Density at 15°C g/cm³
	(A)	(B)	(C)
1	1	1.84	1.000578

148. WEAK ACIDS AND BASES: pK VALUES

pK values (dissociation constants) were determined at 25°C. pK values quoted for bases are for the *acidic* dissociation process. Thus the pK value 9.245, given for ammonia, corresponds to the dissociation $NH_4^+ \rightarrow H^+ + NH_3$. The *basic* dissociation constant, corresponding to the dissociation $NH_3 + H_2O \rightarrow NH_4^+ + OH^-$, is 4.752 (13.997 minus 9.245), where 13.997 is the dissociation constant of water at 25°C.

	Acid or Base	pK
	(A)	(B)
1	Acetic acid	4.756
2	Alanine	pK_1 2.348; pK_2 9.866
3	*p*-Aminobenzoic acid	pK_1 2.413; pK_2 4.853
4	Ammonia	9.245

149. ACID - BASE INDICATORS: pH RANGES

A solution containing 0.1% indicator is generally satisfactory. Although some of the indicators are water-soluble, 70-90% ethanol is recommended as the solvent for most.

	Indicator	pH Range	Acid Color	Basic Color
	(A)	(B)	(C)	(D)
1	Methyl violet 6B	0.1-1.5	Yellow	Blue
2	Thymol blue (acid range)	1.2-2.8	Red	Yellow
3	Tropaeolin 00	1.4-3.2	Red	Yellow
4	Dimethyl yellow	2.8-4.0	Red	Yellow
5	Methyl orange	3.1-4.4	Red	Yellow
6	Bromphenol blue	3.2-4.6	Yellow	Blue
7	Bromcresol green	3.8-5.4	Yellow	Blue
8	Methyl red	4.2-6.2	Red	Yellow
9	Chlorphenol red	5.0-6.8	Yellow	Red
10	Bromcresol purple	5.2-6.8	Yellow	Purple
11	Bromthymol blue	6.0-7.6	Yellow	Blue
12	Phenol red	6.6-8.2	Yellow	Red
13	Neutral red	6.8-8.0	Red	Yellow
14	Cresol red	7.2-8.8	Yellow	Red
15	Thymol blue (alk. range)	8.0-9.6	Yellow	Blue
16	Phenolphthalein	8.2-10.0	Colorless	Pink
17	Thymolphthalein	9.4-10.6	Colorless	Blue
18	Alizarin yellow R	10.2-12.0	Yellow	Red
19	Nitramine	10.8-12.8	Colorless	Orange-brown
20	Trapaeolin 0	11.2-12.8	Yellow	Orange-brown
21	1, 3, 5-Trinitrobenzene	12.0-14.0	Colorless	Orange

151. RADIONUCLIDES USED IN BIOLOGICAL RESEARCH

Type (column D): α = alpha particle, a positively charged particle emitted by radioactive atomic nuclei at high speed, and having a mass number 4 and atomic number 2; β = beta particle, an electron, negative (β^- = negatron) or positive (β^+ = positron), emitted from the nucleus during radioactive disintegration; γ = gamma ray, electromagnetic radiation of short wavelength and correspondingly high frequency, emitted by the nucleus of an atom in the course of radioactive decay; ε = orbital electron capture, radioactive transformation occurring when a bound electron merges with the nucleus, converting a proton to a neutron, with liberation of energy in the form of a monoenergetic neutrino plus a photon of X ray characteristic of the new substance (it is a type of beta decay).

153. FIXATIVES AND CLEARING AGENTS

Part I. FIXATIVES

For additional information, consult references 4 and 6. Formol or formalin = 36-40% aqueous solution of formaldehyde, U.S.P. Alcohol may be ethanol, methanol, or isopropanol.

	Fixative	Recommended Uses	Ingredients	Duration of Application	Subsequent Treatment	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
1	Allen's B-15	Mammalian cytology	75 ml saturated aqueous solution of picric acid[1], 25 ml formol, 5 ml glacial acetic acid, 2 g urea. Just before use, add 1.5 g chromic acid.	12-24 hr	Brief tap-water rinse. Alcohol series to 70% overnight (small pieces of material).	5
2	Bouin's (picro-formol-acetic)	General fixative	75 ml saturated aqueous solution of picric acid[1], 25 ml formol, 5 ml glacial acetic acid.	24+ hr	Brief rinse in 30-50% alcohol. Store in 70% alcohol.	5
3	Carnoy's	Eggs of various invertebrates, glycogen, Nissl substance	10 ml glacial acetic acid, 30 ml chloroform, 60 ml 100% ethanol.	2-12 hr, according to size	Wash in 95% alcohol. Store in 70% alcohol.	5

/1/ Remove picric acid from spread sections with a few drops of saturated aqueous solution of lithium carbonate in any dilution of alcohol.

continued

153. FIXATIVES AND CLEARING AGENTS

Part I. FIXATIVES

	Fixative	Recommended Uses	Ingredients	Duration of Application	Subsequent Treatment	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
4	Champy's	Small animals; for good detail	0.4 g chromic anhydride CrO_3, 1.2 g potassium bichromate. Dissolve in 60 ml distilled water; add 40 ml 1% aqueous solution of osmic acid.	6-24 hr	Wash in tap water 12+ hr. Store in 70% alcohol.	1
5	Craf	Plants, general fixative	**Solution A**: 1 g chromic anhydride, 7 g glacial acetic acid, 92 ml distilled water. **Solution B**: 30 ml formalin, 70 ml distilled water. Just before use, mix equal parts of **A** and **B**.	12-24 hr	Wash in tap water 12-24 hr. Store in 70% alcohol.	1
6	Flemming's weak	Minute and delicate objects; for good cytoplasmic detail	0.25 g chromic acid, 0.10 g osmic acid, 0.10 ml glacial acetic acid, 100 ml water.	2-24 hr, according to size; best results at 0.5°C	Wash in tap water 2-24 hr. Store in 70% alcohol.	1
7	Formalin solution	Animals, general fixative	10 ml formalin, 90 ml distilled water.	24+ hr	Wash in tap water. Store in 10% formalin or 70% alcohol.	1
8	Formalin-acetic	Plant and animal tissues, general fixative	10 ml formalin, 5 ml glacial acetic acid, 85 ml 70% ethanol.	24+ hr	Wash in tap water. Store in 70% alcohol.	1
9	Gilson's	Small invertebrates, amphibian eggs, general purpose	15 ml 70-80% nitric acid, 4 ml glacial acetic acid, 100 ml 60% ethanol, 880 ml distilled water, 20 g mercuric chloride[a].	6+ hr	Wash in tap water. Store in 70% alcohol.	5
10	Helly's	Hematopoietic tissue	2.5 g potassium dichromate, 5 g mercuric chloride[a], 100 ml distilled water. Just before use, add 5 ml formalin.	6-24 hr	Wash 12+ hr in tap water, or in weak formol in dark.	1,3
11	Petrunkewitsch's	General purpose	**Solution A**: 100 ml distilled water, 12 ml nitric acid, 8 g cupric nitrate. **Solution B**: 100 ml 80% ethanol, 4 g phenol, 6 ml ethyl ether. Just before use, mix 1 part **A** with 3 parts **B**.	24-72 hr	Wash in tap water. Store in 70% ethanol.	3
12	Susa-Heidenhain's	General purpose	4.5 g mercuric chloride[a], 80 ml distilled water. Mix, then add 0.5 g sodium chloride, 2 g trichloracetic acid, 4 ml glacial acetic acid, 20 ml formalin.	3-24 hr, according to size	Wash in tap water 12-24 hr, or in 70% alcohol.	1
13	Worcester's	Eggs of fish and amphibia; embryos; general fixative	90 ml 10% formalin saturated with mercuric chloride[a], 10 ml glacial acetic acid.	12-24 hr, according to size	Wash in tap water. Store in 70% alcohol.	5
14	Zenker's	Animal tissues, small pieces	25 g potassium dichromate, 5 g mercuric chloride[a], 5 ml glacial acetic acid, 100 ml water.	4-24 hr	Wash in tap water 12-24 hr. Store in 70% alcohol.	1

/a/ Remove mercuric chloride from spread sections with Gram's solution (formula: 5 ml water, 1 g iodine, 2 g potassium iodide; add water to make 300-ml solution). [2]

153. FIXATIVES AND CLEARING AGENTS

Part II. CLEARING AGENTS

Recommended for use in cytology and histology, unless otherwise indicated. Alcohol may be ethanol, methanol, or isopropanol.

	Clearing Agent	Preceding Dehydrator	Method of Application	Duration of Application	No. of Changes	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
1	Anilin oil	30% alcohol	Immersion in mixtures 50:50 of anilin oil, and 30%, 50%, 70% alcohol; then pure anilin oil	1-2 hr each mixture; 2-4 hr pure anilin	1 for mixture; 2 for pure oil	1
2	Benzene	95 or 100% alcohol, or triethyl phosphate, or cellosolve	Immersion	Until translucent (1-3 hr)	3-5	1
3	Cedar wood oil[1]	80-100% alcohol	Layer alcohol over oil in vial; add specimen	Until specimen sinks to bottom	Fresh oil once after sinking	1
4	Petrolatum ether	95 or 100% alcohol, or triethyl phosphate, or cellosolve	Immersion	Until translucent (1-3 hr)	3-5	2
5	Toluene	95 or 100% alcohol, or triethyl phosphate, or cellosolve	Immersion	Until translucent (1-3 hr)	3-5	1
6	Xylene	95 or 100% alcohol, or triethyl phosphate, or cellosolve	Immersion	Until translucent (approximately 3 hr)	3-5	1

/1/ For use in cytology only.

154. STAINING METHODS

Part I. LIVING MATERIALS

	Material to be Stained	Animal	Stain	Application	Dose: Unit	Dose: No.	Subsequent Treatment	Reference
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
1	Bone matrix	Young mammals	1-2% aqueous solution of alizarin red; pH 8.0	Intraperitoneal	50-80 mg/kg	1 to several at desired intervals	Fix in 10% formalin (sections not decalcified).	2
2	Eggs	Amphibians, fishes	1% nile blue sulfate adsorbed on small, dry slips of agar	Apply agar slips to egg surface	15-30 min	1	At desired stage of development, fix in Zenker's fluid; wash briefly. Transfer to 1% aqueous solution of phosphomolybdic acid for 1 hr. Dehydrate in alcohol + 1% phosphomolybdic acid.	2
3		Amphibians, lamprey	1% bismarck brown, adsorbed on small, dry slips of agar	Apply agar slips to egg surface	15-30 min	1	Fix in 8.5 ml 100% alcohol, 15 ml glacial acetic acid. Transfer directly to cedar oil for storage.	2
4	Epithelial cells of convoluted tubules in kidney	Mouse	0.5% trypan blue in sterile water	Intraperitoneal	0.1-0.2 ml	4 at 48 hr intervals	Fix in 10% formalin; embed in paraffin.	2
5	Fats, fat cells	Cat	20% Sudan III, or Sudan IV, in olive oil	Pass by tube to stomach	5-10 ml	1	After 3-7 da, freeze sections of fat deposit areas.	1

154. STAINING METHODS

Part I. LIVING MATERIALS

	Material to be Stained	Animal	Stain	Application	Dose: Unit	Dose: No.	Subsequent Treatment	Reference
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
6	Mitochondria	Mammals	Janus green-B, 1:10,000 in saline	Ventricle or aorta by gravity pressure, with temporary occlusion of inferior or superior vena cava	About 10 min, or until pancreas shows staining		Examine in saline.	2
7	Blood monocytes, tissue phagocytes	Rabbits	50% Higgins ink in sterile distilled water	Injection into marginal ear vein	5 ml	Daily for 3 da; twice thereafter at 3-da intervals	For blood smears, use Wright's stain. Fix tissues in 10% formalin; embed in paraffin.	2
8	Blood monocytes	Mouse	0.5% trypan blue in sterile water	Intraperitoneal	0.2-0.5 ml	4 at 48 hr intervals	Withdraw blood from tail vein and examine fresh or in dry smear.	1
9	Peripheral nerve endings	Mammals (usually cat)	0.2% aqueous methylene blue at 37°C	Intravenous injection after saline perfusion	Same amount as saline	1	After 30 min, immerse desired part in 0.1% methylene blue, at 37°C, until bluish, then in 8% ammonium molybdate for 30 min. Dehydrate in alcohol.	3
10	Phagocytes, loose connective tissue	Mouse	0.5% trypan blue in sterile water	Subcutaneous	0.2-0.5 ml	4 at 48 hr intervals	Fix in 10% formalin; embed in paraffin.	1
11		Common laboratory mammals	50% Higgins ink in sterile water	Subcutaneous	0.1-1.0 ml according to size		Fix in any good fixative; embed in paraffin.	2
12	Reticulo-endothelial phagocytes of spleen, liver, bone marrow, adrenals, lymph nodes	Mouse	0.5% trypan blue in sterile water	Intraperitoneal	0.2-0.5 ml	4 at 48 hr intervals	Fix in 10% formalin; embed in paraffin.	1
13	Teeth (dentin and enamel)	Young dog, before formation of permanent teeth	1% solution trypan blue in sterile water	Intraperitoneal	2-5 ml	5 at 1, 2, 3, 4, and 5 da intervals	Place head in 10% formalin at 35°C. Dehydrate jaws in alcohol, benzene; impregnate with benzol-damar for grinding.	2
14	Teeth	Young dog	1% aqueous solution of alizarin red	Intravenous and/or intraperitoneal	50-80 mg/kg	Several	Fix in formalin; grind.	2

154. STAINING METHODS

Part II. FIXED MATERIALS

Procedure (columns C-G): all solutions are aqueous, unless otherwise stated; H_2O refers to distilled water; ethanol, without qualification, refers to commercial "190 proof neutral grain spirits," and absolute (abs.) ethanol refers to "pure ethyl alcohol, U.S.P., 200 proof." *Abbreviations:* sat. = saturated; sol. = solution(s).

	Dye or Technique	Recommended Material	Procedure					Reference
			1st step	2nd step	3rd step	4th step	5th step	
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
1	Heidenhain's iron hematoxylin	Nuclei, particularly mitotic figures, in sections	Mordant in 2.5% ferric alum overnight.	Rinse in H_2O. Stain 12-24 hr in 0.5% hematoxylin at least 1 mo old.	Rinse in H_2O. Differentiate in 2.5% ferric alum.	Place in alkaline tap water until blue. Steps 3 and 4 may be repeated.	Wash, dehydrate, clear, and mount in neutral balsam or synthetic substitute.	23
2	Ehrlich's hematoxylin	Nuclei in sections subsequently to be counterstained	Dissolve 0.7 g hematoxylin in 30 ml ethanol and 3 ml acetic acid. Mix 30 ml sat. sol. ammonia alum with 30 ml glycerol and add to dye sol. Ripen 3 mo.	Take sections to ethanol, then stain 0.5-2 min.	Apply ethanol from drop bottle until nuclei are differentiated.	Place in alkaline tap water until blue.	Wash, dehydrate, clear, and mount in neutral balsam or synthetic substitute.	6
3	Delafield's hematoxylin	Whole mounts of plants or animals	Dissolve 0.6 g hematoxylin in 70 ml sat. sol. ammonia alum; add 15 ml glycerol, 15 ml methanol, and 5 ml ethanol. Ripen 3 mo.	Take object to H_2O. Stain from 2 min (in full-strength stain for minute objects) to 2 da (in 1:10 dilution for a liver fluke).	Wash in H_2O until no color comes away.	Differentiate, if necessary, in 0.1% HCl in 70% ethanol. Place in alkaline tap water until blue throughout.	Wash, dehydrate, clear, and mount in neutral balsam or synthetic substitute.	1
4	Gray's celestin blue-B	Nuclei and mitotic figures in sections	Mix 1 g celestin blue-B with 0.5 ml H_2SO_4. Break up mass and add slowly, with constant stirring, 100 g 2.5% ferric alum with 14 ml glycerol heated to 50°C. Cool and adjust to pH 0.8 with H_2SO_4.	Take sections to H_2O. Stain 1 min or more (overstaining is impossible).	Rinse in tap water until no color comes away.	Dehydrate, clear, and mount in balsam.		2
5	Johansen's safranin	Nuclei in sections of animal tissue; nuclei and xylem in sections of plant tissues	Dissolve 0.1 g safranin-O in 50 ml methyl cellosolve; add 25 ml ethanol. Dissolve 1 g sodium acetate in 25 ml H_2O with 2 ml 40% formaldehyde; add to dye sol.	Take sections to H_2O. Stain 1-3 da.	Differentiate in 0.5% picric acid in 65% ethanol.	Wash in running tap water until yellow color is removed.	Dehydrate, clear, and mount in balsam.	11
6	Bismarck brown	Whole mounts of small plants or animals	Take objects to H_2O. Stain 1-5 min in 1% bismarck brown.	Wash until no color comes away.	Dehydrate, clear, and mount in balsam.			11
7	Grenacher's alcoholic borax carmine	Whole mounts of plants or animals; nuclei in sections of plant or animal tissues	Boil 1.5 g carmine with 2 g borax in 50 ml H_2O for 30 min. Cool; add 50 ml 70% ethanol. Leave 2 da and filter.	Take objects to H_2O. Stain overnight.	Differentiate objects in 0.1% HCl in 70% ethanol until clear pink (sections rarely require differentiation).	Dehydrate, clear, and mount in balsam.		9

154. STAINING METHODS

Part II. FIXED MATERIALS

	Dye or Technique	Recommended Material	Procedure: 1st step	2nd step	3rd step	4th step	5th step	Reference
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
8	Mayer's paracarmine	Whole mounts of small invertebrates, particularly marine forms and their larvae	Dissolve 1 g carmine acid in 70% ethanol; add 4 g strontium chloride and 0.5 g aluminum chloride.	Take objects to 50% ethanol. Stain overnight.	Differentiate in 0.1% strontium chloride in 70% ethanol.	Dehydrate, clear, and mount in balsam.		18
9	La Cour's aceto-orcein	Chromosomes in squashes	Dissolve 1 g orcein in equal parts acetic acid and water.	Squash material in stain under cover. Examine at intervals until maximum intensity of stain is reached.	Place slide on "dry ice" until cover slip is well frosted.	Pry off cover slip with safety razor blade. Place slide in 70% ethanol.	Dehydrate, clear, and mount in balsam.	13
10	Eosin-Y; ethyl eosin	Contrast stain for black or blue nuclei, particularly in sections of animal material	Dissolve 0.5 g eosin-Y in H_2O, or 0.5 g ethyl eosin in ethanol.	Take sections with prestained nuclei to H_2O for eosin-Y, or to ethanol for ethyl eosin.	Place sections in stain until preferred intensity is reached.	Dehydrate, clear, and mount in balsam.		13
11	Light green; fast green FCF	Contrast stain for red nuclei, particularly in sections of plant tissues	Dissolve 0.5 g of either dye in ethanol.	Take sections with prestained nuclei to ethanol.	Place sections in stain until preferred intensity is reached.	Dehydrate, clear, and mount in balsam.		13
12	Smith's picro-spirit blue	Double contrast stain for red nuclei, particularly in sections of embryos with heavy yolk	Dissolve 1 g picric acid in 100 ml abs. ethanol. Saturate with spirit blue (about 1.2 g).	Bulk stain amphibian embryos with Grenacher's alcoholic borax carmine. Cut 10-μ sections. Take to abs. ethanol.	Place in stain 2 min.	Differentiate in abs. ethanol.	Clear in xylene. Steps 3, 4, and 5 may be repeated. Mount in balsam.	21
13	Shumway's picro-indigo carmine	Double contrast stain for red nuclei, particularly in sections of amniote embryos	Mix equal parts of sat. sol. of picric acid and indigo carmine.	Take sections with prestained nuclei to water. Stain 5 min.	Differentiate in 70% ethanol.	Transfer to abs. ethanol for not more than 15 sec.	Clear in xylene, mount in balsam.	20
14	Patay's ponceau 2R-light green	Double contrast stain for blue or black nuclei in sections	Take sections with prestained nuclei to H_2O.	Stain 2 min in 1% ponceau 2R.	Rinse briefly in H_2O. Differentiate 2 min in 1% phosphomolybdic acid.	Rinse briefly in H_2O. Stain 30 sec in 0.5% light green in 90% ethanol.	Dehydrate, clear, and mount in balsam.	19
15	Gray's ponceau 2R-orange 2	Double contrast stain for blue or black nuclei in sections	Take sections with prestained nuclei to H_2O.	Stain 2 min in 100 ml H_2O, 0.4 g ponceau 2R, 0.6 g orange 2.	Blot slides, then dip up and down in abs. ethanol until differentiated.	Clear in xylene, mount in balsam.		8
16	Masson's triple contrast	Triple contrast stain for blue or black nuclei in sections	Take sections with nuclei, prestained preferably with Gray's celestin blue-B, to H_2O.	Stain 5 min in 100 ml H_2O, 1 ml acetic acid, 0.35 g acid fuchsin, 0.65 g ponceau 2R.	Rinse briefly in H_2O. Differentiate 5 min in 1% phosphomolybdic acid.	Rinse briefly in H_2O; drain. Flood slide with sat. sol. anilin blue in 2.5% acetic acid; leave 2-5 min. Differentiate in 1% acetic acid.	Pass directly to 0.1% acetic acid in abs. ethanol. Dehydrate, clear in xylene containing 1% salicylic acid; mount in balsam similarly acidified.	17

continued

154. STAINING METHODS

Part II. FIXED MATERIALS

	Dye or Technique	Recommended Material	Procedure					Ref-er-ence
			1st step	2nd step	3rd step	4th step	5th step	
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
17	Mallory's triple stain	General stain for sections of animal tissues	Stain 2 min in 1% acid fuchsin.	Rinse in H_2O. Differentiate 2 min in 1% phosphotungstic acid.	Rinse in H_2O. Stain 10 min in 100 ml H_2O, 0.5 g methyl blue, 1 g orange G2, 1 g oxalic acid.	Wash in H_2O until no color comes away. Dip up and down in abs. ethanol until differentiated.	Clear in xylene and mount in balsam preferably containing 1% salicylic acid.	15
18	Johansen's quadruple stain	General stain for sections of plant tissues	Stain 24 hr in Johansen's safranin, but do not differentiate. Rinse in H_2O. Stain 10-15 min in 1% methyl violet.	Differentiate 15 sec in mixture of equal parts ethanol, methyl cellosolve, tertiary butanol.	Stain 10-15 min in sat. sol. of fast green FCF in 13 ml equal parts ethanol and methyl cellosolve, 36 ml ethanol, 36 ml tertiary butanol, 12 ml acetic acid.	Rinse in 0.5% acetic acid in equal parts ethanol and tertiary butanol. Stain 3 min in sat. sol. of orange G in equal parts ethanol, tertiary butanol, and methyl cellosolve.	Rinse in equal parts ethanol, methyl cellosolve, and clove oil. Rinse in equal parts ethanol, clove oil, and xylene. Clear in xylene and mount in balsam.	10
19	Wright's methylene blue-eosin	Blood smears	Prepare blood smear; allow to dry.	Place 3 drops of Wright's stain on smear.	Exactly 1 min later, add 6 drops of phosphate pH 6.4 buffer.	2 min later, wash thoroughly with H_2O.	Allow slide to dry.	24
20	Anderson's "Weigert-Pal" stain	Demonstration of nerve tracts by staining myelin sheaths in 30-μ frozen sections	Boil together 100 ml H_2O, 5 g potassium dichromate, 2.5 g chromic fluoride; cool, filter. To this stock sol., add immediately before use, 10% of 2% calcium hypochlorite. Stain sections 2-3 da.	Transfer sections to stock mordant sol. without hypochlorite for 15-60 min.	Dissolve 0.5 g hematoxylin in 10 ml abs. ethanol; add 3 ml 2% calcium hypochlorite. Shake well; dilute with H_2O to 100 ml; add 3 ml acetic acid. Transfer sections from mordant, without rinsing, and heat to 50°C for 1 hr.	Transfer sections, without washing, to 100 ml H_2O, 2.5 g boron dichromate, 1 g sodium sulfate. Wash thoroughly. Transfer to fresh 0.25% potassium permanganate until brown.	Transfer, without washing, to 100 ml H_2O, 0.5 g potassium sulfite, 0.5 g oxalic acid until bleached. Repeat until differentiation is complete. Wash thoroughly, dehydrate, clear, and mount in balsam.	3
21	Davenport-Windle-Rhine protein silver stain	Demonstration of nerve tracts by staining axis cylinders in paraffin sections	Cut 10-μ paraffin sections of material fixed in 50 ml H_2O, 50 ml ethanol, 5 ml *p*-nitrophenol, 10 ml formamide.	Deparaffinize mounted sections and bring to H_2O. Place in 5% silver nitrate at 60°C for 1 hr.	Wash in 3 successive, 30-sec changes of H_2O. Transfer to 0.2% protargol for 1 hr.	Rinse quickly in H_2O. Transfer to 100 ml H_2O, 5 g sodium sulfite (desiccated), 1 g hydroquinone, 0.5 g potassium metaborate for 1 min. Wash thoroughly in running water.	Transfer to 0.2% gold chloride until gray. Rinse quickly and place in 0.4% oxalic acid until section just starts to darken. Rinse. Fix in 5% sodium thiosulfate. Wash thoroughly, dehydrate, clear, and mount in balsam.	4

continued

154. STAINING METHODS

Part II. FIXED MATERIALS

	Dye or Technique	Recommended Material	Procedure					Reference
			1st step	2nd step	3rd step	4th step	5th step	
	(A)	(B)	(C)	(D)	(E)	(F)	(G)	(H)
22	Kull's method for mitochondria	Mitochondria in 5-μ paraffin sections	Fix small pieces for 25 hr in 100 ml H_2O, 0.5 g osmic acid, 0.5 g chromic acid, 1.25 g potassium dichromate.	Wash 30 min in H_2O. Transfer to 85 ml H_2O, 15 ml pyroligneous acid, 1 g chromic acid for 24 hr.	Wash 30 min in H_2O. Transfer to 3% potassium dichromate for 24 hr. Wash 24 hr in running water. Cut 5-μ paraffin sections; take sections to H_2O.	Saturate hot anilin with acid fuchsin. Shake thoroughly with equal quantity of H_2O. Separate and retain aqueous fraction. Flood sol. on slide and heat to steaming for 1 min.	Rinse quickly in H_2O. Place in 0.5% toluidine blue for 1-2 min. Rinse quickly in H_2O. Differentiate 0.5% aurantia in 70% ethanol. Dehydrate in acetone, clear in xylene, and mount in balsam.	12
23	Ludford's method for Golgi apparatus	Golgi in 5-μ paraffin sections	Fix small pieces (earthworm ovary is excellent) for 1 hr in 100 ml H_2O, 0.5 g osmic acid, 4 g mercuric chloride, 1 g sodium chloride.	Place specimen on bottom of 30-ml stoppered bottle; add just enough 2% osmic acid to cover specimen. Keep 2 wk at room temperature.	Fill bottle with H_2O and keep 2 da at 38°C. Wash in running water.	Cut 5-μ paraffin sections. Mount and deparaffinize with xylene.	Examine sections of Golgi apparatus; if not clear, place in turpentine until differentiated. Wash in xylene, and mount in balsam.	14
24	Hucker's crystal violet	Bacterial smears	Dissolve 2 g crystal violet in 20 ml ethanol. Dissolve 0.8 g ammonium oxalate in 80 ml H_2O; add to dye sol.	Spread thin film of bacteria and allow to dry. Pass through flame.	Flood dye sol. on smear. Leave 30 sec.	Wash off dye sol. with jet H_2O from wash bottle.	Allow film to dry.	5
25	Gram's stain	Demonstration of gram-positive bacteria	Follow steps 1, 2, and 3 for Hucker's crystal violet.	Rinse quickly in beaker of H_2O; add few drops of 0.5% iodine in 1% potassium iodide. Leave 1 min.	Rinse quickly in H_2O. Place in abs. ethanol until no color comes away.	Stain 5-10 sec in 1% safranin-O. Wash and dry.		5
26	Margolena's stain	Demonstration of parasitic fungi in sections of plant tissues	Dissolve 0.1 g thionine and 5 g phenol in 95 ml H_2O. Stain sections 1 hr.	Rinse in H_2O. Place in 0.5% light green in ethanol for 1 min.	Wash in H_2O until no color comes away. Dehydrate in abs. ethanol.	Mix 30 ml sat. sol. orange G in ethanol with 60 ml sat. sol. erythrosin in clove oil. Stain 1-2 min.	Rinse in clove oil, clear in xylene, and mount in balsam.	16
27	Alizarin red	Demonstration of bone, or calcified areas, in whole mounts of small animals	Fix or preserve specimens in ethanol, or formaldehyde made alkaline with borax.	Bring specimens to 70% ethanol. Stain 1-12 hr in mixture of 1 ml sat. ethanol sol. alizarin red S with 100 ml sat. sol. borax in 70% ethanol.	Transfer to sat. sol. borax in 90% ethanol until no color comes away.	Dehydrate, clear, and mount in balsam.		7

155. HISTOCHEMICAL TESTS

Abbreviations: conc. = concentrated; sat. = saturated; sol. = solution.

	Substance	Preparation of Tissue	Preparation of Reagents	Test Method	Result	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
1	Lipids	Fix in 4% formaldehyde containing 1% calcium chloride. Cut frozen sections, if necessary, after embedding in gelatin.	Digest 1 g Sudan black B in 100 ml 60% triethyl phosphate at 100°C for 5 min with constant agitation. Cool, then filter.	Stain section 2-5 min. Wash in 60% triethyl phosphate. Wash in H_2O and stain carmine-light green. Mount in aqueous medium.	Lipid granules, black; nuclei, red; cytoplasm, green.	4
2	Cholesterol	Cut frozen sections of fresh or formaldehyde-fixed material.		Strand section on slide. Drain well. Cover with 2 drops conc. H_2SO_4 for 10 sec. Add 2 drops acetic anhydride, wait 10 sec, then wash thoroughly with acetic anhydride. Place cover slip on section.	Cholesterol shows green, or blue-green. Preparation cannot be preserved.	10

continued

	Substance	Preparation of Tissue	Preparation of Reagents	Test Method	Result	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
3	Glycogen	Fix in ethanol at 0^oC. Cut 10-μ paraffin sections and mount on slide; deparaffinize in xylene. Rinse in equal parts ethanol and ether. Dip in collodion U.S.P.	Boil 2 g carmine, 1 g potassium carbonate, and 5 g potassium chloride in 60 ml H_2O for 5 min. Cool, then add 20 ml ammonium hydroxide. For use, dilute 10 ml of this stock sol. with 15 ml ammonium hydroxide and 15 ml ethanol.	Stain collodionized sections in celestin blue B. Wash thoroughly in water. Stain in carmine 15 min. Rinse thoroughly in methanol, dehydrate in acetone, clear in xylene, and mount in balsam.	Nuclei, black; glycogen granules, scarlet.	1
4	Starch	Fix in any dichromate--chromic acid--formaldehyde fixative. Cut paraffin sections.	Saturate hot anilin with acid fuchsin. Shake well, separate, and retain water fraction.	Pour acid fuchsin stain on sections; heat to steaming for 1 min. Rinse in H_2O and place in 5% aurantia in ethanol until no color comes away. Rinse in 70% ethanol and transfer to 2% tannic acid for 15 min. Transfer directly to 1% methyl green for 10 min. Differentiate in ethanol until starch grains are sharply distinct.	Plastids, proplastids, and mitochondria, red; starch, green. The standard iodine test for starch does not yield permanent preparations.	6
5	Mucin	Cut paraffin sections of material fixed in any mercuric chloride or dichromate fixative.		Stain 10-40 sec in 1% Alcian Blue. Rinse quickly in H_2O and transfer for 2 hr to 0.5% borax in 80% ethanol. Dehydrate and mount in balsam.	Mucin, bright blue. Stained sections may be counterstained in hematoxylin-eosin if further histological detail is desired.	12
6	Celluloses	Sections of plant tissues, or teased fibers.	Dissolve 2 g iodine and 5 g potassium iodide in a small amount of H_2O. Dilute to 100 ml. Add 10 ml iodine sol. and 0.25 ml glycerol to 90 ml H_2O.	Cover specimen with iodine sol. for 15 sec. Blot dry. Add 1 drop of sat. aqueous sol. lithium carbonate. Apply cover slip.	Pure cellulose, blue; impure celluloses, various shades of green, yellow, and brown.	9
7	Lignin	Sections of plant tissues, or teased fibers.		Place in 1% phloroglucinol for 2 min. Blot and add 1 drop of HCl.	Lignin, red.	9
8	Chitin	Sections of tissues.	Dissolve 10 g anilin hydrochloride in 100 ml 1% HCl. Stain sections 5 min.	Transfer to 7.5% potassium dichromate for 1 min. Rinse in H_2O and place in alkaline tap water until color changes from green to blue.	Chitin, blue.	2
9	DNA	Sections or smears of either animal or plant material.	Boil 1 g magenta ("basic" fuchsin) in 100 ml H_2O. Add 20 ml *N* HCl. Cool, filter, and add 5 ml 10% sodium bisulfite. Leave in dark 24 hr.	Hydrolyze material 20 min in *N* HCl. Stain 2 hr in dark. Bleach cytoplasm 1-2 min in freshly made 100 ml H_2O, 5 ml 10% sodium bisulfite, 5 ml *N* HCl. Counterstain in light green if desired. Dehydrate, clear, and mount in balsam.		3
10	RNA	10-μ paraffin sections of tissues.	Shake 0.5 g methyl green with successive batches of chloroform until all chloroform-soluble color is removed. Add 13 ml of purified dye sol. to 50 ml pH 4.8 acetate buffer and 37 ml 0.5% pyroam G.	Take sections to H_2O. Blot. Stain 30 min. Blot. Pass to acetone 1 min, and 50:50 acetone-xylene 1 min. Clear in xylene and mount in balsam.	RNA, blue to blue-green; DNA, red.	5

continued

	Substance	Preparation of Tissue	Preparation of Reagents	Test Method	Result	Reference
	(A)	(B)	(C)	(D)	(E)	(F)
11	Proteins	10-μ sections of neutral formaldehyde-fixed material.	Mix 95 ml ethanol with 0.5 ml 0.2 *N* sodium hydroxide. Add 0.5 g 2,4-dinitro-fluorobenzene.	Take sections to H_2O. Stain 24 hr. Rinse thoroughly in ethanol, then H_2O. Bleach in 5% sodium thiosulfate 40 min at 37°C. Rinse in H_2O. Add 5 ml ice-cold 4*N* H_2SO_4 to 100 ml ice-cold 5% sodium nitrate. Soak bleached sections 4-5 min. Rinse in H_2O. Transfer to 2% H-acid in barbitone-acetate pH 9.2 buffer for 15 min. Rinse in H_2O, dehydrate, clear, and mount in balsam.	Protein, purple-red.	11
12	Iron	10-μ, or thicker, sections of tissues fixed in iron-free, neutral formaldehyde.		Take sections to H_2O. Place in 2% potassium ferrocyanide with equal volume of 0.2 *N* HCl and stain 20 min. Dehydrate, clear, mount in balsam.	Reactive iron, blue. Non-reactive iron (e.g., in hemoglobin) may be rendered reactive by treating sections for 30 min, before staining, in alkaline H_2O_2.	7
13	Hemoglobin	10-μ, or thicker, sections of tissues fixed in neutral formaldehyde.	Dissolve 1-2 g benzidine in 100 ml methanol with 1.2 ml acetic acid. Add 0.12 g sodium nitroprusside.	Deparaffinize sections in xylene. Remove xylene completely in several changes of methanol. Stain 10 min. Wash in 50 ml methanol, 25 ml ether, 25 ml 3% H_2O_2. Dehydrate, clear, and mount in balsam.	Hemoglobin, bright blue.	8
14	Carotene	Immerse plant tissues in 20 ml sat. aqueous sol. potassium hydroxide, 15 ml ethanol, 85 ml H_2O in dark until all green removed.		Wash pieces thoroughly in H_2O. Place fragment on slide, blot, and cover with H_2SO_4.	Areas of dark blue crystals indicate carotene locations.	13

Appendix II. TAXONOMIC CLASSIFICATION: LIVING ANIMALS

Phylum: **CHORDATA**

Subphylum: VERTEBRATA
- Class: **Mammalia** [6]
  - Subclass: Theria
    - Infraclass: Eutheria
      - Order: Artiodactyla
        - Suborder: Ruminantia
        - Suborder: Tylopoda
        - Suborder: Suiformes
      - Order: Perissodactyla
        - Suborder: Ceratomorpha
        - Suborder: Hippomorpha
      - Order: Sirenia
      - Order: Hyracoidea
      - Order: Proboscidea
      - Order: Tubulidentata
      - Order: Carnivora
        - Suborder: Pinnipedia
        - Suborder: Fissipeda
      - Order: Cetacea
        - Suborder: Mysticeti
        - Suborder: Odontoceti
      - Order: Rodentia
        - Suborder: Hystricomorpha
        - Suborder: Myomorpha
        - Suborder: Sciuromorpha
      - Order: Lagomorpha
      - Order: Pholidota
      - Order: Edentata
      - Order: Primates
        - Suborder: Anthropoidea
        - Suborder: Prosimii
      - Order: Chiroptera
        - Suborder: Microchiroptera
        - Suborder: Megachiroptera
      - Order: Dermoptera
      - Order: Insectivora
    - Infraclass: Metatheria
      - Order: Marsupialia
  - Subclass: Prototheria
    - Order: Monotremata
- Class: **Aves** [7]
  - Order: Passeriformes
    - Suborder: Passeres
    - Suborder: Menurae
    - Suborder: Tyranni
    - Suborder: Eurylaimi
  - Order: Piciformes
    - Suborder: Pici
    - Suborder: Galbulae
  - Order: Coraciiformes
    - Suborder: Bucerotidae
    - Suborder: Coracii
    - Suborder: Meropes
    - Suborder: Alcedines
  - Order: Trogoniformes
  - Order: Coliiformes
  - Order: Apodiformes
    - Suborder: Trochili
    - Suborder: Apodi
  - Order: Caprimulgiformes
    - Suborder: Caprimulgi
    - Suborder: Steatornithes
  - Order: Strigiformes
  - Order: Cuculiformes
    - Suborder: Cuculi
    - Suborder: Musophagi
  - Order: Psittaciformes
  - Order: Columbiformes
    - Suborder: Columbae
    - Suborder: Pterocletes
  - Order: Charadriiformes
    - Suborder: Alcae
    - Suborder: Lari
    - Suborder: Charadrii
  - Order: Gruiformes
    - Suborder: Otides
    - Suborder: Cariamae
    - Suborder: Eurypygae
    - Suborder: Rhynocheti
    - Suborder: Heliornithes
    - Suborder: Grues
    - Suborder: Turnices
    - Suborder: Mesitornithides
  - Order: Galliformes
    - Suborder: Opisthocomi
    - Suborder: Galli
  - Order: Falconiformes
    - Suborder: Falcones
    - Suborder: Cathartae
  - Order: Anseriformes
    - Suborder: Anseres
    - Suborder: Anhimae
  - Order: Ciconiiformes
    - Suborder: Phoenicopteri
    - Suborder: Ciconiae
    - Suborder: Balaenicipites
    - Suborder: Ardeae
  - Order: Pelecaniformes
    - Suborder: Fregatae
    - Suborder: Pelecani
    - Suborder: Phaëthontes
  - Order: Procellariiformes
  - Order: Podicipediformes
  - Order: Gaviiformes
  - Order: Tinamiformes
  - Order: Apterygiformes
  - Order: Casuariiformes
  - Order: Rheiformes
  - Order: Struthioniformes
  - Order: Sphenisciformes
- Class: **Reptilia** [4,5]
  - Order: Serpentes
  - Order: Sauria
  - Order: Crocodylia
  - Order: Chelonia
    - Suborder: Pleurodira
    - Suborder: Cryptodira
  - Order: Rhynchocephalia
- Class: **Amphibia** [2,4]
  - Order: Gymnophiona
  - Order: Salientia
    - Suborder: Diplasiocoela
    - Suborder: Procoela
    - Suborder: Anomocoela
    - Suborder: Opisthocoela
    - Suborder: Amphicoela
  - Order: Caudata
    - Suborder: Meantes
    - Suborder: Proteida
    - Suborder: Salamandroidea
    - Suborder: Ambystomoidea
    - Suborder: Cryptobranchoidea
- Class: **Pisces** [3,4]
  - Subclass: Crossopterygii
    - Order: Dipnoi
    - Order: Actinistia
  - Subclass: Neopterygii
    - Order: Synbranchii
      - Suborder: Synbranchoidea
      - Suborder: Alabetoidea
    - Order: Opisthomi
    - Order: Pediculati
      - Suborder: Ceratioidea
      - Suborder: Antennarioidea
      - Suborder: Lophioidea
    - Order: Haplodoci
    - Order: Xenopterygii
    - Order: Malacicthyes
    - Order: Plectognathi
      - Suborder: Tetraodontoidea
      - Suborder: Balistoidea
    - Order: Discocephali
    - Order: Heterosomata
    - Order: Hypostomides
    - Order: Thoracostei
    - Order: Scleroparei
      - Suborder: Cephalacanthoidea
      - Suborder: Scorpaenoidea
    - Order: Percomorphi
      - Suborder: Polynemoidea
      - Suborder: Mugiloidea
      - Suborder: Channoidea
      - Suborder: Anabantoidea
      - Suborder: Stromateoidea
      - Suborder: Ophidioidea
      - Suborder: Blennioidea
      - Suborder: Callionymoidea
      - Suborder: Gobioidea
      - Suborder: Scombroidea
      - Suborder: Trichiuroidea
      - Suborder: Siganoidea
      - Suborder: Acanthuroidea
      - Suborder: Percoidea
    - Order: Zeomorphi
    - Order: Berycomorphi
      - Suborder: Xenoberyces
      - Suborder: Berycoidea
    - Order: Allotriognathi
    - Order: Anacanthini

  - Order: Radiolaria
- Class: **Rhizopoda**
  - Order: Foraminifera
  - Order: Testacea
  - Order: Amoebina
  - Order: Rhizomastigina
- Class: **Mastigophora**
  - Subclass: Zoomastigina
    - Order: Opalinina
    - Order: Distomatina
    - Order: Metamonadina
    - Order: Protomonadina
  - Subclass: Phytomastigina
    - Order: Chrysomonadina
    - Order: Coccolithophorida
    - Order: Silicoflagellata
    - Order: Ebriideae
    - Order: Dinoflagellata
    - Order: Cryptomonadina
    - Order: Euglenoidina
    - Order: Chloromonadina
    - Order: Xanthomonadina
    - Order: Phytomonadina

Appendix III. TAXONOMIC CLASSIFICATION: LIVING PLANTS

Part I. NONVASCULAR PLANTS

Phylum: VIRA [2]

Order: Virales
Order: Rickettsiales

Phylum: BACTERIOPHYTA [1,2]

Class: **Schizomycetes**
- Order: Pseudomonadales
- Order: Chlamydobacteriales
- Order: Hyphomicrobiales
- Order: Eubacteriales
- Order: Actinomycetales
- Order: Caryophanales
- Order: Beggiatoales
- Order: Myxobacterales
- Order: Spirochaetales
- Order: Mycoplasmatales
- *Incertis sedis*

Phylum: MYXOPHYTA [2]

Class: **Myxomyceteae**
- Order: Exosporales
- Order: Stemonitales
- Order: Liceales
- Order: Trichiales
- Order: Physarales
- Order: Hydromyxales

Class: **Acrasieae**
- Order: Acrasiales
- Order: Labyrinthulales

Class: **Plasmodiophoreae**
- Order: Plasmodiophorales

Phylum: FUNGI [2]

Class: **Phycomycetes**
- Order: Chytridiales
- Order: Hyphochytriales
- Order: Blastocladiales
- Order: Monoblepharidales
- Order: Saprolegniales
- Order: Lagenidiales
- Order: Peronosporales
- Order: Mucorales
- Order: Entomophthorales
- Order: Zoopagales
- Order: Eccrinales

Class: **Ascomycetes**
- Order: Endomycetales
- Order: Taphrinales
- Order: Plectascales
- Order: Myriangiales
- Order: Erysiphales
- Order: Dothideales
- Order: Pseudosphaeriales
- Order: Hemisphaeriales
- Order: Sphaeriales
- Order: Hypocreales
- Order: Clavicipitales
- Order: Pezizales
- Order: Helotiales
- Order: Hysteriales
- Order: Tuberales
- Order: Laboulbeniales

Class: **Basidiomycetes**
- Order: Uredinales
- Order: Ustilaginales
- Order: Auriculariales
- Order: Dacrymycetales
- Order: Tremellales
- Order: Tulasnellales
- Order: Polyporales
- Order: Agaricales
- Order: Protogastrales
- Order: Hymenogastrales
- Order: Phallales
- Order: Sclerodermatales
- Order: Nidulariales
- Order: Sphaerobolales
- Order: Lycoperdales

Class: **Fungi Imperfecti**
- Order: Sphaeropsidales
- Order: Melanconiales
- Order: Moniliales
- *Incertis sedis*
  - Mycelia sterilia

Phylum: LICHENES [2,3]

Class: **Phycolichenes**
- Order: Geosiphonales

Class: **Ascolichenes**
- Order: Verrucariales
- Order: Pyrenulales
- Order: Pyrenidiales
- Order: Dermatinales
- Order: Caliciales
- Order: Graphidiales
- Order: Roccellales
- Order: Thelotrematales
- Order: Cyanophilales
- Order: Lecidiales
- Order: Lecanorales
- Order: Caloplacales

Class: **Basidiolichenes**
- Order: Corales

Class: **Lichenes Imperfecti**

Phylum: ALGAE [3]

Division: CYANOPHYTA
- Class: **Cyanophyceae**
  - Order: Chroococcales
  - Order: Pleurocapsales
  - Order: Chamaesiphonales
  - Order: Hormogonales
    - Suborder: Nostocinales
    - Suborder: Stigonematinales

Division: EUGLENOPHYTA
- Class: **Euglenophyceae**
  - Order: Euglenales
    - Suborder: Eugleninales
    - Suborder: Colaciinales

Division: PYRROPHYTA
- Class: **Cryptophyceae**
  - Order: Monomastigales
  - Order: Cryptomonadales
  - Order: Phaeocapsales
  - Order: Cryptococcales
- Class: **Chloromonadophyceae**
  - Order: Chloromonadales
- Class: **Desmokontae**
  - Order: Desmomonadales
  - Order: Prorocentrales
  - Order: Dinophysalidales
  - Order: Desmocapsales
- Class: **Dinophyceae**
  - Subclass: Dinoflagellatae
    - Order: Gymnodiniales
    - Order: Blastodiniales
    - Order: Peridiniales
  - Subclass: Phytodiniformes
    - Order: Rhizodiniales
    - Order: Dinocapsales
    - Order: Dinococcales
    - Order: Dinotrichales

Division: CHRYSOPHYTA
- Class: **Heterokontae**
  - Order: Heterochloridales
  - Order: Rhizochloridales
  - Order: Heterocapsales
  - Order: Heterococcales
  - Order: Heterotrichales
  - Order: Heterosiphonales
- Class: **Chrysophyceae**
  - Order: Chrysomonadales
    - Suborder: Chromulininales
    - Suborder: Isochrysidinales
    - Suborder: Ochromonadinales
  - Order: Silicoflagellatae
    - Suborder: Siphonotestinales
    - Suborder: Stereotestinales
  - Order: Rhizochrysidales
  - Order: Chrysocapsales
  - Order: Chrysosphaerales
  - Order: Chrysotrichales
- Class: **Bacillariophyceae**
  - Subclass: Centricae
    - Order: Discales
    - Order: Soleniales
    - Order: Biddulphiales
  - Subclass: Pennatae
    - Order: Araphidales
    - Order: Raphidioidales
    - Order: Monoraphidales
    - Order: Biraphidales

Division: CHLOROPHYTA
- Class: **Chlorophyceae**
  - Order: Chlorochytridiales
  - Order: Volvocales
    - Suborder: Chlamydomonadinales
    - Suborder: Tetrasporinales
    - Suborder: Chlorodendrinales
  - Order: Chlorococcales
  - Order: Ulotrichales
    - Suborder: Ulotrichinales
    - Suborder: Ulvinales
    - Suborder: Schizogoniinales
    - Suborder: Sphaeropleinales
  - Order: Chaetophorales
  - Order: Cladophorales
  - Order: Oedogoniales
  - Order: Conjugatae
    - Suborder: Euconjugatae
    - Suborder: Desmidiinales
  - Order: Siphonales

Division: CHAROPHYTA
- Class: **Charophyceae**
  - Order: Charales

continued

Appendix III. TAXONOMIC CLASSIFICATION: LIVING PLANTS

Part I. NONVASCULAR PLANTS

- Division: PHAEOPHYTA
  - Class: **Isogeneratae**
    - Order: Ectocarpales
    - Order: Sphacelariales
    - Order: Cutleriales
    - Order: Tilopteridales
    - Order: Dictyotales
  - Class: **Heterogeneratae**
    - Subclass: Haplostichidae
      - Order: Chordariales
      - Order: Sporochnales
      - Order: Desmarestiales
    - Subclass: Polystichidae
      - Order: Dictyosiphonales
      - Order: Laminariales
  - Class: **Cyclosporeae**
    - Order: Fucales
- Division: RHODOPHYTA
  - Class: **Bangiophyceae**
    - Order: Porphyridiales
    - Order: Goniotrichales
    - Order: Bangiales
    - Order: Compsopogonales
    - Order: Rhodochaetales
  - Class: **Florideae**
    - Order: Nemalionales
    - Order: Gelidiales
    - Order: Cryptonemiales
    - Order: Gigartinales
    - Order: Rhodymeniales
    - Order: Ceramiales

Phylum: **BRYOPHYTA** [2]

- Class: **Musci**
  - Order: Sphagnales
  - Order: Andreaeales
  - Order: Archidiales
  - Order: Dicranales
  - Order: Fissidentales
  - Order: Pottiales
  - Order: Grimmiales
  - Order: Funariales
  - Order: Schistostegales
  - Order: Tetraphidales
  - Order: Eubryales
  - Order: Isobryales
  - Order: Hookeriales
  - Order: Hypnobryales
  - Order: Buxbaumiales
  - Order: Polytrichales
  - Order: Dawsoniales
- Class: **Hepaticae**
  - Order: Jungermaniales
  - Order: Calobryales
  - Order: Acrogynales
  - Order: Sphaerocarpales
  - Order: Marchantiales
- Class: **Anthocerotae**
  - Order: Anthocerotales

Appendix IV. GEOLOGIC DISTRIBUTION: ANIMALS AND PLANTS

	Era (Duration, yr)	Period (Duration, yr) [Years Ago]	Epoch	Advances in Life	Dominant Life
	(A)	(B)	(C)	(D)	(E)
1	Cenozoic (60 million)	Quaternary (2 million) [2 million]	Recent	Rise of civilization	Man and herbaceous plants
2			Pleistocene	Periodic glaciation; extinction of great mammals and many trees; rise of modern herbs; elevation of continents	Mammals, birds, and flowering plants
3		Tertiary (58 million) [60 million]	Pliocene	Continued cooling of climate; elevation of Andes; increasing restriction of plant distribution and forests; appearance of man	
4			Miocene	Greatly changing climate, becoming cool and semiarid; elevation of Alps; restriction of distribution of plants; beginning of forest reduction; culmination of many mammals	
5			Oligocene	Warm, humid climate; elevation of Pyrenees; culmination of Eocene floras; worldwide distribution of tropical forests; disappearance of primitive mammals; rise of higher mammals and birds	
6			Eocene	Cool climate, semiarid, then warm and humid; modernization of flowering plants; development of extensive forests, widespread in polar regions; appearance of modern birds and marine mammals	
7	Mesozoic (125 million)	Cretaceous (65 million) [125 million]	Upper Cretaceous	Fluctuating climate; angiosperms dominant in floras, dicotyledons, and monocotyledons of numerous existing genera well-developed; disappearance of Bennettitales; rise of primitive mammals	Reptiles and higher gymnosperms
8			Middle Cretaceous	Fluctuating climate; rapid development of angiosperms, appearance of many existing genera; specialization and extinction of great reptiles	
9			Lower Cretaceous	Very warm climate; rise of angiosperms (?); conifers and cycads still dominant; earliest known pines (Pinaceae)	
10		Jurassic (32 million) [157 million]	Jurassic	Warm climate; beginning of Sierra Nevada mountains; first definitely known angiosperms; conifers and cycads dominant; Ginkgoales and conifers worldwide; disappearance of cordaites; primitive birds and flying reptiles; rise of higher insects	
11		Triassic (28 million) [185 million]	Triassic	Warm, semiarid climate; nonluxuriant floras; increase in gymnosperms, spread of conifers, rise of cycads and Bennettitales; disappearance of seed ferns; diversification of modern fern families well under way; first mammals; rise of giant reptiles (dinosaurs)	
12	Paleozoic (368 million)	Carboniferous	Permian (38 million) [223 million]	Dry climate; periodic glaciation, severe in southern hemisphere; elevation of Appalachians; dwindling of ancient groups, extinction of many; rise of ferns and conifers and of land vertebrates; expansion of reptiles; Gondwana flora of southern hemisphere distinct from those in northern hemisphere	Amphibians, lycopods, and seed ferns
13			Pennsylvanian (48 million) [271 million]	Lycopods, seed ferns, and horsetails dominant; sphenophylls, Coniferales and calamites present; extensive coal formation	
14			Mississippian (38 million) [309 million]	Lycopods, horsetails, and seed ferns dominant; cordaites, sphenophylls, and calamites present; rise of primitive reptiles and insects	
15		Devonian (45 million) [354 million]	Devonian	Early land floras: Psilophytales (*Rhynia*, *Horneophyton*); lycopods; primitive horsetails, including sphenophylls; primitive gymnosperms (earliest cordaites and seed ferns, their seeds not yet known); first forests; rise of amphibians and fishes	Fishes and early land plants
16		Silurian (27 million) [381 million]	Silurian	Algae dominant (e.g., *Nematophyton hicksi*); rise of lungfishes and scorpions (first air-breathing animals)	Higher invertebrates and algae
17		Ordovician (67 million) [448 million]	Ordovician	Rise of corals, armored fishes (and land plants ?); marine algae dominant; first known freshwater fishes	
18		Cambrian (105 million) [553 million]	Cambrian	Warm climate, uniform over earth; first abundance of fossils; many groups of marine invertebrates; dominant trilobites; marine plants, few algae determinable; evidence from microfossils may indicate land plants	

continued

Appendix IV. GEOLOGIC DISTRIBUTION: ANIMALS AND PLANTS

	Era (Duration, yr)	Period (Duration, yr) [Years Ago]	Epoch	Advances in Life	Dominant Life
	(A)	(B)	(C)	(D)	(E)
19	Protero-zoic (900 million)	Precambrian [1.5 billion]	Precambrian	Rocks chiefly sedimentary, and of enormous thickness; glaciation; first fossils: worms, crustaceans, brachiopods; evidence of algal and bacterial life	Primitive marine invertebrates (fossils rare)
20	Archeo-zoic (550+ million)	[3.5-5.0 billion]		Igneous rocks: lavas and metamorphosed rocks; few sedimentary; no direct evidence of life; graphites of possible organic origin in sedimentary rocks of Grenville series	Unicellular life? (fossils unknown)

Appendix V. FORMULAS, FACTORS, AND CONSTANTS

Part I. CONVERSION FORMULAS

mEq/L ⟷ mg/100 ml

$$\text{mEq/L} = \frac{\text{mg/100 ml x valence x 10}}{\text{atomic weight}}$$

$$\text{mg/100 ml} = \frac{\text{mEq/L x atomic weight}}{\text{valence x 10}}$$

ml (milliliters) ⟷ g (grams)

$$\text{ml} = \frac{\text{g}}{\text{specific gravity}}$$

g = ml x specific gravity

Temperature: ^{o}C ⟷ ^{o}F

$^{o}C = (^{o}F - 32) \times 5/9$

$^{o}F = (^{o}C \times 9/5) + 32$

mM/L ⟷ mg/100 g

$$\text{mM/L} = \frac{\text{mg/100 g x 10}}{\text{atomic weight}}$$

$$\text{mg/100 g} = \frac{\text{mM/L x atomic weight}}{10}$$

Wet basis ⟷ dry basis

$$\text{Wet basis} \rightarrow \text{dry basis} = \frac{100 \times a}{b}$$

$$\text{Dry basis} \rightarrow \text{wet basis} = \frac{a \times b}{100}$$

a = % of material determined (wet or dry)
b = % of dry sample (100 - c = b)
c = % moisture in sample

Appendix V. FORMULAS, FACTORS, AND CONSTANTS

Part IV. PHYSICAL CONSTANTS

Speed of light in a vacuum; also, ratio of emu to esu of electric charge *(c)*	$(2.99776 \pm 0.00004) \times 10^{8}$ m/sec
Charge of an electron *(e)*	$(1.6020 \pm 0.0002) \times 10^{-19}$ coulomb
Faraday's constant *(F)*[1]	$(96{,}522 \pm 7)$ coulombs/mole
Avogadro's number (N_o)[2]	$(6.0251 \pm 0.0004) \times 10^{23}$
Standard atmospheric pressure (P_o)	$(101{,}324.6 \pm 0.4)$ nt/sq m
Freezing point of water on the absolute (Kelvin) scale (T_o)	(273.16 ± 0.02) °K
Density of mercury at STP	$(13{,}595.04 \pm 0.06)$ kg/cu m
Atomic weight of oxygen, physical scale[3]	(16.00436 ± 0.00009)
Volume of a mole of perfect gas at STP (V_o)	$(22{,}420.7 \pm 0.6)$ cu cm
Universal gas constant (R_o)	$(8{,}316.6 \pm 0.4)$ joules/kg·°K
Boltzmann's constant *(k)*, the gas constant per molecule	$(1.3803 \pm 0.0001) \times 10^{-23}$ joule/°K
Mass of atom of unit atomic weight (m_1), physical scale[3]	$(1.6589 \pm 0.0014) \times 10^{-24}$g
Mass of electron (m_e)	$(9.103 \pm 0.008) \times 10^{-28}$g
Mechanical equivalent of heat	$(4{,}185.5 \pm 0.4)$ joules/kcal
Gravitation constant *(G)*	$(6.670 \pm 0.005) \times 10^{-11}$ nt·sq m/sq kg
Planck's (quantum) constant *(h)*	$(6.623 \pm 0.001) \times 10^{-34}$ joule·sec

/1/ The charge transported by a gram atom of a univalent element. /2/ The number of molecules in a gram molecule, or of atoms in a gram atom. /3/ An atomic weight of 16 for oxygen (as determined by chemical analysis) is the basis for the chemical scale of atomic weights. In the physical scale the value of 16 is assigned to the most abundant isotope of oxygen. Physical scale atomic weights are larger than those in the chemical scale, by a ratio of 1.00027 to 1.

Appendix VI. ATOMIC WEIGHTS

Values in parentheses are mass numbers of the most stable known isotopes.

	Element (A)	Symbol (B)	Atomic No. (C)	Atomic Wt. (D)
1	Actinium	Ac	89	(227)
2	Aluminum	Al	13	26.98
3	Americium	Am	95	(243)
4	Antimony	Sb	51	121.76
5	Argon	Ar	18	39.944
6	Arsenic	As	33	74.91
7	Astatine	At	85	(210)
8	Barium	Ba	56	137.36

INDEX

It is suggested that the index be used in conjunction with the table of contents: the index to locate data for a specific organism, and the table of contents to determine the scope of the data for a particular topic. To facilitate identification, the index includes the taxonomic order for animals, and the family for plants, unless otherwise specified. As a further aid, the index lists the animals and plants as they are presented in the tables. Entries for a particular organism may therefore be found under the common name, under the scientific name, or under both. Where information is available under both, cross-references make the data easily accessible.

* indicates diagram, drawing, or graph

13. ABSTRACT

The Biology Data Book has been compiled to present numerical data of biology and medicine in a convenient and accessible form for reference, and to standardize accepted constants as a basis for correlation, establish common standards for statistical studies, and provide normal values for research. The biology data are organized in the form of tables, diagrams, charts, and graphs, arranged under the following headings: Genetics and Cytology, Reproduction, Development and Growth, Morphology, Nutrition and Digestion, Metabolism, Respiration and Circulation, Blood, Biological Regulators and Toxins, Biophysical and Biochemical Characteristics, Environment and Survival, Parasitism, and Materials and Methods, Seven appendices provide information concerning estimated number of species, taxonomic classification for living plants and animals, geologic distribution, atomic weights, as well as logarithms and antilogarithms. A detailed index completes the book. The contents have been authenticated by 470 authorities in the fields of biology and medicine. The review process of the tables was designed to eliminate, insofar as possible, errors of transcription and material of questionable validity.

INSTRUCTIONS

1. ORIGINATING ACTIVITY: Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization *(corporate author)* issuing the report.

2*a*. REPORT SECURITY CLASSIFICATION: Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2*b*. GROUP: Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. REPORT TITLE: Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. DESCRIPTIVE NOTES: If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. AUTHOR(S): Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. REPORT DATE: Enter the date of the report as day, month, year; or month, year. If more than one date appears on the report, use date of publication.

7*a*. TOTAL NUMBER OF PAGES: The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7*b*. NUMBER OF REFERENCES: Enter the total number of references cited in the report.

8*a*. CONTRACT OR GRANT NUMBER: If appropriate, enter the applicable number of the contract or grant under which the report was written.

8*b*, 8*c*, & 8*d*. PROJECT NUMBER: Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9*a*. ORIGINATOR'S REPORT NUMBER(S): Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9*b*. OTHER REPORT NUMBER(S): If the report has been assigned any other report numbers *(either by the originator or by the sponsor)*, also enter this number(s).

10. AVAILABILITY/LIMITATION NOTICES: Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:

(1) "Qualified requesters may obtain copies of this report from DDC."

(2) "Foreign announcement and dissemination of this report by DDC is not authorized."

(3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through
_______________________________."

(4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through
_______________________________."

(5) "All distribution of this report is controlled. Qualified DDC users shall request through
_______________________________."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. SUPPLEMENTARY NOTES: Use for additional explanatory notes.

12. SPONSORING MILITARY ACTIVITY: Enter the name of the departmental project office or laboratory sponsoring *(paying for)* the research and development. Include address.

13. ABSTRACT: Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as *(TS), (S), (C), or (U)*

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. KEY WORDS: Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
