

FOREWORD

This report presents the results of one segment of an experimental program for the investigation of hypersonic flow separation and control characteristics being conducted by the Research Department of Grumman Aircraft Engineering Corporation, Bethpage, N. Y. Mr. Donald E. Hoak of the Flight Dynamics Laboratory, Research and Technology Division, located at Wright-Patterson Air Force Base, Ohio, is the Air Force Project Engineer for the program, which is being supported primarily under Contract AF 33(616)-8130, Air Force Task 821902.

The experimental data to be obtained, pressure distributions, heat transfer, and six component aerodynamic force data, are extensive and must be presented in a series of reports, of which this is one. These data reports are presented without analysis for the purpose of disseminating experimental information as rapidly as possible. Analyses of the data will be presented in the final report for the subject contract.

The author wishes to express his appreciation to the staff of the von Karman Facility, ARO Inc., for their helpfulness in conducting the tests and particularly to Messrs. Burchfield and Deitering for providing the machine plotted graphs of the experimental data included in this report. The tabulated data, not included herein, are available to qualified Air Force requestors as an appendix to this report. The appendix can be obtained on loan from the Flight Dynamics Laboratory, Research and Technology Division, Air Force Systems Command, Wright-Patterson Air Force Base, Ohio.

Contrails

ABSTRACT

Pressure data were obtained at Mach 8 for a winged re-entry configuration having aerodynamic controls. The basic model consisted of a clipped delta wing with an overslung cone-cylinder body. The main controls tested were partial span trailing edge flaps. Data were also obtained on the effect of tip fins, hemisphere-cylinder body and a trailing edge spoiler. The data were obtained over an angle of attack range of -50° to $+50^{\circ}$. Due to load limitations on the controls the unit test section Reynolds number varied from 3.3×10^6 at low angle of attack to 2.5×10^6 at high angle of attack.

This report has been reviewed and is approved.

INTRODUCTION

The Fluid Mechanics Section of the Grumman Research Department is currently engaged in a research program directed at determining flow separation phenomena and the effectiveness of aerodynamic controls on hypersonic flight vehicles. The program consists of theoretical and experimental research on "basic" configurations, flat plates with wedge-shaped flaps and fins, and "typical" hypersonic glide vehicles, a clipped delta wing-body combination, and a pyramidal body. The configurations under investigation in the over-all program are shown in Fig. 1a.

This report presents the results of one segment of the experimental program. It treats a winged hypersonic glider configuration consisting, in basic form, of a clipped delta wing with an overslung cone-cylinder body. This configuration was used for obtaining pressure and heat transfer data on various aerodynamic controls at hypersonic Mach numbers. The pressure data results are presented herein and the heat transfer results will be presented in a subsequent report (Ref. 1). The controls investigated were partial span trailing edge flaps, with deflection ranges of -39° to $+39^\circ$, a full span plug-type trailing edge spoiler and tip fins. An overslung hemisphere-cylinder body was also tested.

The experimental work was done at the AEDC 50-inch Mach 8 Hypersonic Wind Tunnel during July and August of 1963. Descriptions of these test facilities can be found in Ref. 2. Pressure data were obtained at a unit Reynolds number varying from 3.3×10^6 to 2.5×10^6 , depending on the angle of attack range, with selected points at a Reynolds number of 1.1×10^6 . The same model was used to obtain heat transfer data in the AEDC 50-inch Hypersonic Tunnel at $M_\infty = 8.0$ and pressure data in the AEDC 40" x 40" Supersonic Tunnel at $M = 5.0$ (Ref. 3). A geometrically similar model, instrumented to obtain force and moment data, was tested in both the 40" and 50" tunnels at an earlier date (Ref. 4). Another geometrically similar model, with limited pressure instrumentation, was tested in the AEDC Hotshot 2 Hypervelocity Tunnel (Ref. 5).

Manuscript released by the author May 1964 for publication as an RTD Technical Documentary Report.

Contrails

DESCRIPTION OF MODELS

Four test configurations were built up from a basic model that consisted of a clipped delta wing with an overslung body. The clipped delta wing had a spherically blunted apex, cylindrically blunted leading edges and a blunt base. Of the control surfaces to be tested, three partial span trailing edge flaps were built into the wing and attachments provided for mounting a full span spoiler. Only the outboard flaps were used in these tests. The flap-type control surfaces were remotely actuated from outside the tunnel. Three-view drawings of the four test configurations are presented in Fig. 1b through e. The dimensions of the basic configurations are shown in Fig. 1b and are the same for all other configurations. The other configuration drawings show dimensions only for the components added to the basic configuration. A summary of the geometric properties of the various model components is presented in Table 2.

The first major configuration consisted of a clipped delta wing with an overslung body. The body was composed of a half-cylindrical after-section and a half-hemispherical fore-section. A conical fairing, uninstrumented, was attached over the fore-section of the body to provide a body shape that was geometrically similar to that used in the force tests (Ref. 4). The half-conical foresection and half-cylindrical aftersection were joined together at the shoulder by a spherical fairing, this wing-body combination is referred to as Configuration I. The second major configuration was obtained by adding a set of tip fins to Configuration I and is referred to as Configuration IV. The tip fins were clipped deltas in elevation and were attached in such a way as not to alter the aspect ratio of the basic configuration. Configurations I and IV provided the pressure data needed to evaluate the force data previously obtained.

The conical forebody of the overslung body generates a weak shock wave on the upper surface. It was also desired to determine the effects of a strong shock generator on the pressure coefficients. With the conical forebody removed the basic, hemispherical-cylindrical overslung body remaining can be considered as a strong shock generator. It was also desired to compare the flow separation characteristics of the partial span trailing edge flaps with those of a trailing edge control that would be expected to induce strong separation effects. Thus, as for the force tests, it was decided to test a full span spoiler and compare the resulting pressure

Controls

distributions to those due to the partial span flaps deflected +20 degrees. The design condition for the full span, plug type, trailing edge spoiler was, therefore, that its height be equal to the vertical displacement of the trailing edge flaps when they are deflected +20 degrees. This spoiler was attached to the lower, flat plate surface at the trailing edge.

It was assumed that the effects of the blunt body and spoiler would be uncoupled because of their locations on opposite surfaces of the wing. Therefore, the hemispherical overslung body and the trailing edge spoiler were tested at the same time and referred to as Configuration VII.* Configuration VIII was obtained by adding the tip fins to Configuration VII.

The sign convention for denoting the angle of attack and the control deflection angle can be obtained from the basic model; namely, a flat plate clipped delta wing with an overslung body. This definition fixes the flat plate surface of the wing as the lower surface. Thus, the angle of attack is positive when the flat plate surface is the windward surface of the model. The control deflection angles are also defined with respect to the lower (flat-plate) surface of the model. If we consider our model at zero angle of attack (flow parallel to the lower flat-plate surface), then positive trailing edge flap deflections are obtained by deflecting the trailing edge down. The outboard partial span trailing edge flaps, designed to operate independently of each other, had a maximum travel angle of ± 40 degrees and could be calibrated to yield any deflection angle in this range.

Each flap-type control was driven by a 28 volt dc, gear reduced, electrical motor through a 1/2 inch-10 acme thread drive screw which was connected to the flap bell cranks by push-pull rods. Control deflection read-outs were obtained through calibrated linear potentiometers. The three motors with their attendant potentiometers and drive screws were located in a water-cooled housing immediately behind the model. The drive screws were connected to the flap bell cranks by push-pull rods that passed through the front of the actuator housing and into the base of the model. This type of actuation system produced a deflection rate of 1 degree/sec. The control surfaces were calibrated cold, that is, when the model was installed in the tunnel, and checked regularly. The calibrating was done with precut templates varying, in 5-degree increments, from 0 degrees to

*In the force tests a full span trailing edge flap and a full span spoiler were tested with the conical overslung body, with and without tip fins, and referred to as Configurations II, III, V, and VI.

Contrails

40 degrees. The potentiometer outputs were recorded visually from Leeds and Northrup Midget Model D indicators for use in setting flap angles during the test. This calibration was also recorded into the digital computing equipment at AEDC for use of the computer during the print-out procedure. The design provided for the independent operation of each control surface. We were thus capable of testing asymmetric, as well as symmetric, control configurations.

The wing of the model was fabricated of an internal stainless steel frame which served as the basic load supporting structure and instrumented surface panels which served as the data gathering units. The flaps were also fabricated the same way; i.e., an internal frame with attached, instrumented, panels. The flaps were connected to the wing structure by hinges and actuated from the actuator housing by a system of bell cranks and push-pull rods. All internal framework was made of 416 stainless steel and the surface panels were pressure relieved, silver braised honeycomb sections where the face sheets, core and frame were of 321 stainless steel. The body and the conical fairing were fabricated of 321 stainless steel sheet. The fins and spoiler were made of solid 321 stainless steel. The actuator housing which served as the connection between the model and the sting, as well as the housing for the actuation motors, was made of 17-4PH stainless steel.

The model was instrumented with 56 pressure taps distributed on the upper and lower surface of the wing and on the half-hemisphere cylinder body. The location of each pressure tap is listed in Table 3 and shown in Fig. 1f. When the conical forebody fairing was installed, seven pressure taps (178-184) were lost and when the spoiler was installed four pressure taps (28, 38, 48, 88) were lost. Installation of the fins did not block any instrumentation.

DESCRIPTION OF WIND TUNNELS AND EQUIPMENT

This segment of the over-all experimental program described in the Introduction was conducted in the 50 in. Mach 8 Hypersonic Wind Tunnel located at Arnold Engineering Development Center's von Karman Facility. A complete description of the wind tunnels and their associated measuring, recording, and tabulating equipment is given in Ref. 2.

Contrails

The angle of attack range was obtained by using two different pre-bend angles on the water-cooled split sting that is standard tunnel equipment. The two pre-bend angles used were 12 degrees and 39 degrees and between them provided an angle of attack range of 0 degrees to +50 degrees. The negative angles of attack were obtained by inverting the model.

TEST CONDITIONS

The test program was conducted at a nominal test section Mach number of 8.0 and test section unit Reynolds numbers ranging from 3.3×10^6 per foot to 1.1×10^6 per foot. Only selected data, to be used for comparative purposes, were obtained at the lowest unit Reynolds number. Most of the program was conducted at unit Reynolds numbers ranging from 3.3×10^6 per foot to 2.5×10^6 per foot. This variation in test section unit Reynolds number was caused by the necessity to reduce the free stream dynamic pressure in order to prevent overloading the control system. Thus the free stream unit Reynolds numbers and dynamic pressures were reduced as the magnitude of the angle of attack increased.

Due to tunnel operating conditions the actual test section Mach number ranged between 8.08 and 8.09. The nominal values of the free stream unit Reynolds number at which data were acquired were 3.3×10^6 , 2.9×10^6 , 2.5×10^6 , and 1.1×10^6 . The variation in Reynolds number, due to tunnel operating conditions, was $\pm 3\%$ maximum with most of the variations being within $\pm 2\%$ of the nominal values.

The two main configurations (I and IV) were tested most extensively while the tests on the other configurations were restricted and are used only to provide comparison data with the main configurations. Configurations I and IV were tested through an angle of attack range from -50 degrees to +50 degrees, for symmetric, partial span, flap deflections of -39 degrees to +39 degrees. Configurations VII and VIII were tested through an angle of attack range of -20 degrees to 0 degrees and provide information on the effect of a strong shock generator and plug type trailing edge spoiler on the pressure distributions and flow field about the delta wing.

A complete tabulation of the test program showing the angle of attack range, control deflection and flow conditions, is presented in Table 1.

DATA REDUCTION AND ACCURACY

All the pressure data were reduced to standard coefficient form using the equation $C_p = \frac{p - p_\infty}{q_\infty}$. The inaccuracy in the measured pressure data varied from ± 0.003 psia, for pressures below 0.40 psia, to 0.26 psia for pressures above 15 psia. Because of this, pressure coefficient uncertainties varied from 0.004 for $C_p < 0.3$ and $Re_\infty/ft = 1.1$ million to 0.13 for $C_p = 2.0$ and $Re_\infty/ft = 3.3$ million.

The automatic plotting machines, used in presenting the data herein, introduce additional errors. The discrepancies in the plotted pressure coefficients due to these machine errors should not exceed ± 0.01 . Nevertheless, there is always the possibility that a point will be completely misplotted. Each graph has been inspected and any questionable points were checked with the tabulated pressure coefficients.

RESULTS AND DISCUSSION

This portion of the over-all test program was designed to provide the pressure data needed to fully exploit the controls information previously obtained (Refs. 1 and 4) on a basic type of hypersonic flight vehicle and to assess the importance of separated flow effects. Data are presented at positive and negative angles of attack for the case of an overslung body mounted on a clipped delta wing.

The model was tested with tip fins on and off, with partial span trailing edge flaps, with a full span trailing edge spoiler, and with a blunt instrumented body as well as the conical body used in the force tests. The experiments were conducted at a nominal Mach number of 8 and with limited Reynolds number comparisons.

The basic wing-body combination was designed to provide pressure data for configurations having either overslung or underslung bodies. For convenience we have chosen the overslung body configuration as our reference, and we have defined the coordinate system and control deflection angles with reference to this basic configuration. Thus the positive angle of attack regime for the overslung body provides the aerodynamic data for the underslung

Contrails

body at negative angles of attack. The sign of the flap deflection angles, for the underslung body case, must be reversed in order that both cases be viewed in the same reference system.

The data are presented in the form of pressure coefficients plotted as functions of nondimensionalized chordwise (streamwise), and spanwise, coordinates. The chordwise coordinate is measured from the virtual apex of the model and the spanwise coordinate from the vertical centerplane of the model. The data obtained on the upper and lower surfaces of the test configuration are presented separately for each set. Thus, for each test configuration, all the data are presented in four graphs (two graphs for the chordwise plots and two graphs for the spanwise plots).

The data for Configuration I are presented in Figs. 3 to 28; for Configuration IV in Figs. 29 to 49; for Configuration VII in Fig. 50 and for Configuration VIII in Fig. 51. The complete test program is tabulated in Table 1 and the specific conditions presented in each figure are noted in the list of illustrations on page VIII.

All pressure taps are located with respect to the virtual apex, and the vertical center plane, of the model. Pressure taps 26 → 88 are on the lower (flat-plate) surface and taps 126 → 184 are on the upper surface of the model.

TABLE IV

DESCRIPTION OF TEST CONFIGURATIONS

CONFIGURATION	DESCRIPTION
I	<p>Basic Configuration (Wing-Body)</p> <p>Wing - Clipped delta wing, spherically blunted apex, cylindrically blunted leading edges, blunt base</p> <p>+ Body - Overslung, half conical forebody and half-cylindrical afterbody</p>
IV	<p>Basic + Tip Fins</p> <p>(I)</p>
VII	<p>Wing - Clipped delta wing, spherically blunted apex, cylindrically blunted leading edges, blunt base</p> <p>+ Body - Overslung, half-hemispherical forebody and half-cylindrical afterbody</p> <p>+ Spoiler - Plug type, trailing edge spoiler</p>
VIII	<p>VII + Tip Fins</p>

Contrails

Separated Flows ahead of a Ramp
Fore and aft flaps, end plates
3 separate models:

- 1) Pressure and heat transfer, AEDC Tunnels A & B, $M = 5$ & 8
- 2) Controlled wall temperature, pressure, AEDC Tunnel B, $M = 8$
- 3) Pressure and heat transfer, Grumman Shock Tunnel, $M \approx 13$ & 19

Wedge - Plate Interaction
Small and large fins with sharp and blunt leading edges
2 separate models:

- 1) Pressure and heat transfer, AEDC Tunnels A & B, $M = 5$ & 8
- 2) Pressure and heat transfer, Grumman Shock Tunnel, $M \approx 13$ & 19

Clipped Delta, Blunt L.E.
Center body, T.E. flaps, drooped nose, spoiler, tip fins
3 separate models:

- 1) Pressure and heat transfer, AEDC Tunnels A & B, $M = 5$ & 8
- 2) Pressure, AEDC Hotshot 2, $M \approx 19$
- 3) Six component force, AEDC Tunnels A & B, $M = 5$ & 8

Delta, Blunt L.E., Dihedral
T.E. flaps, canard, ventral fin
3 separate models:

- 1) Pressure and heat transfer, AEDC Tunnels A & B, $M = 5$ & 8
- 2) Pressure and heat transfer, Grumman Shock Tunnel, $M \approx 19$
- 3) Six component force, AEDC Tunnels A & B, $M = 5$ & 8

13. ABSTRACT <p>Pressure data were obtained at Mach 8 for a winged re-entry configuration having aerodynamic controls. The basic model consisted of a clipped delta wing with an overslung cone-cylinder body. The main controls tested were partial span trailing edge flaps. Data were also obtained on the effect of tip fins, hemisphere-cylinder body and a trailing edge spoiler. The data were obtained over an angle of attack range of -50° to +50°. Due to load limitations on the controls the unit test section Reynolds number varied from 3.3 x 10⁶ at low angle of attack to 2.5 x 10⁶ at high angle of attack.</p>

14.	KEY WORDS	LINK A		LINK B		LINK C	
		ROLE	WT	ROLE	WT	ROLE	WT
	<p>hypersonic control pressure measurements winged re-entry flow separation control characteristics</p>						

INSTRUCTIONS

1. **ORIGINATING ACTIVITY:** Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (*corporate author*) issuing the report.
- 2a. **REPORT SECURITY CLASSIFICATION:** Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.
- 2b. **GROUP:** Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.
3. **REPORT TITLE:** Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.
4. **DESCRIPTIVE NOTES:** If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.
5. **AUTHOR(S):** Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.
6. **REPORT DATE:** Enter the date of the report as day, month, year, or month, year. If more than one date appears on the report, use date of publication.
- 7a. **TOTAL NUMBER OF PAGES:** The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.
- 7b. **NUMBER OF REFERENCES:** Enter the total number of references cited in the report.
- 8a. **CONTRACT OR GRANT NUMBER:** If appropriate, enter the applicable number of the contract or grant under which the report was written.
- 8b, 8c, & 8d. **PROJECT NUMBER:** Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.
- 9a. **ORIGINATOR'S REPORT NUMBER(S):** Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.
- 9b. **OTHER REPORT NUMBER(S):** If the report has been assigned any other report numbers (*either by the originator or by the sponsor*), also enter this number(s).
10. **AVAILABILITY/LIMITATION NOTICES:** Enter any limitations on further dissemination of the report, other than those

imposed by security classification, using standard statements such as:

- (1) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. **SUPPLEMENTARY NOTES:** Use for additional explanatory notes.
12. **SPONSORING MILITARY ACTIVITY:** Enter the name of the departmental project office or laboratory sponsoring (*paying for*) the research and development. Include address.
13. **ABSTRACT:** Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. **KEY WORDS:** Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
