

# **Damping of Precision Metal Matrix Trusses**

EAC-1

**Presented at : Damping '91  
February 13-15, 1991  
Catamaran Hotel  
San Diego, CA**

**S. S. Simonian  
14 February 1991**

# AGENDA

- **OBJECTIVE**
- **MOTIVATION**
- **STRUCTURE CONFIGURATION**
- **MATERIALS**
- **TECHNICAL APPROACH**
- **DISTURBANCES**
- **DESIGN CONSIDERATIONS**
- **ANALYSIS RESULTS**

EAC-2

# OBJECTIVE

**DAMMPS Program :  
Damping and metal matrix for precision structures**

**TO DEMONSTRATE THE DIMENSIONAL  
PRECISION OF DAMPED AEROSPACE  
STRUCTURES UNDERGOING DYNAMIC  
AND THERMAL EFFECTS**

EAC-3

# MOTIVATION

- WHY design damping into structures ?
- Inherent damping of spacecraft: Is it sufficient ?

- **Deterministic dynamic performance analysis model :**

$$\begin{aligned} \text{Modal damping} &\equiv 0.5\% \quad (\text{mean} - 2 \text{ sigma}) \\ &\equiv 0.2\% \quad (\text{mean} - 2.5 \text{ sigma}) \end{aligned}$$

- Often damping requirements are 5-20% to meet performance measures
- This provides the rationale for the need for integral damping design in spacecraft

# WHY MMC & DISCRETE DAMPERS ?

- **Application: Generic Truss Structures**
- **Approaches: Discrete → Links, Joints**  
**Distributed → Free layer, Constrained layer**
- **Tubular truss structures**
  - Requirements:**
    1. **High precision & stability (hysteresis, moisture, CTE)**
    2. **High specific stiffness**
    3. **High damping**
    4. **Simple and reliable design & analysis**
  - Solution:**
    - **Items 1 & 2 - MMC Materials**
    - **Items 3 & 4 - DISCRETE dampers**
- **Thus for tubular precision truss structures MMC materials and discrete VEM dampers provide the best solution for above requirements**

# STRUCTURE CONFIGURATION

- Precision Truss Structures

- Widely used structural system with superior weight-stiffness characteristics

- Traceable to large number military and scientific space projects

DAMMPS

# Truss Assembly

EAC-10

# MATERIAL REQUIREMENTS

- MMC Material Considerations
  - SSS (Strength, Stiffness, Stability)
- Viscoelastic Material (VEM) Considerations
  - High Loss Factors with broad temperature response
  - Desirable stiffness over temperature and frequency
  - Low outgassing properties

# **DSA Tube Requirements and MMC Material Objectives**

**Tubes are Part of Precision Structure -**

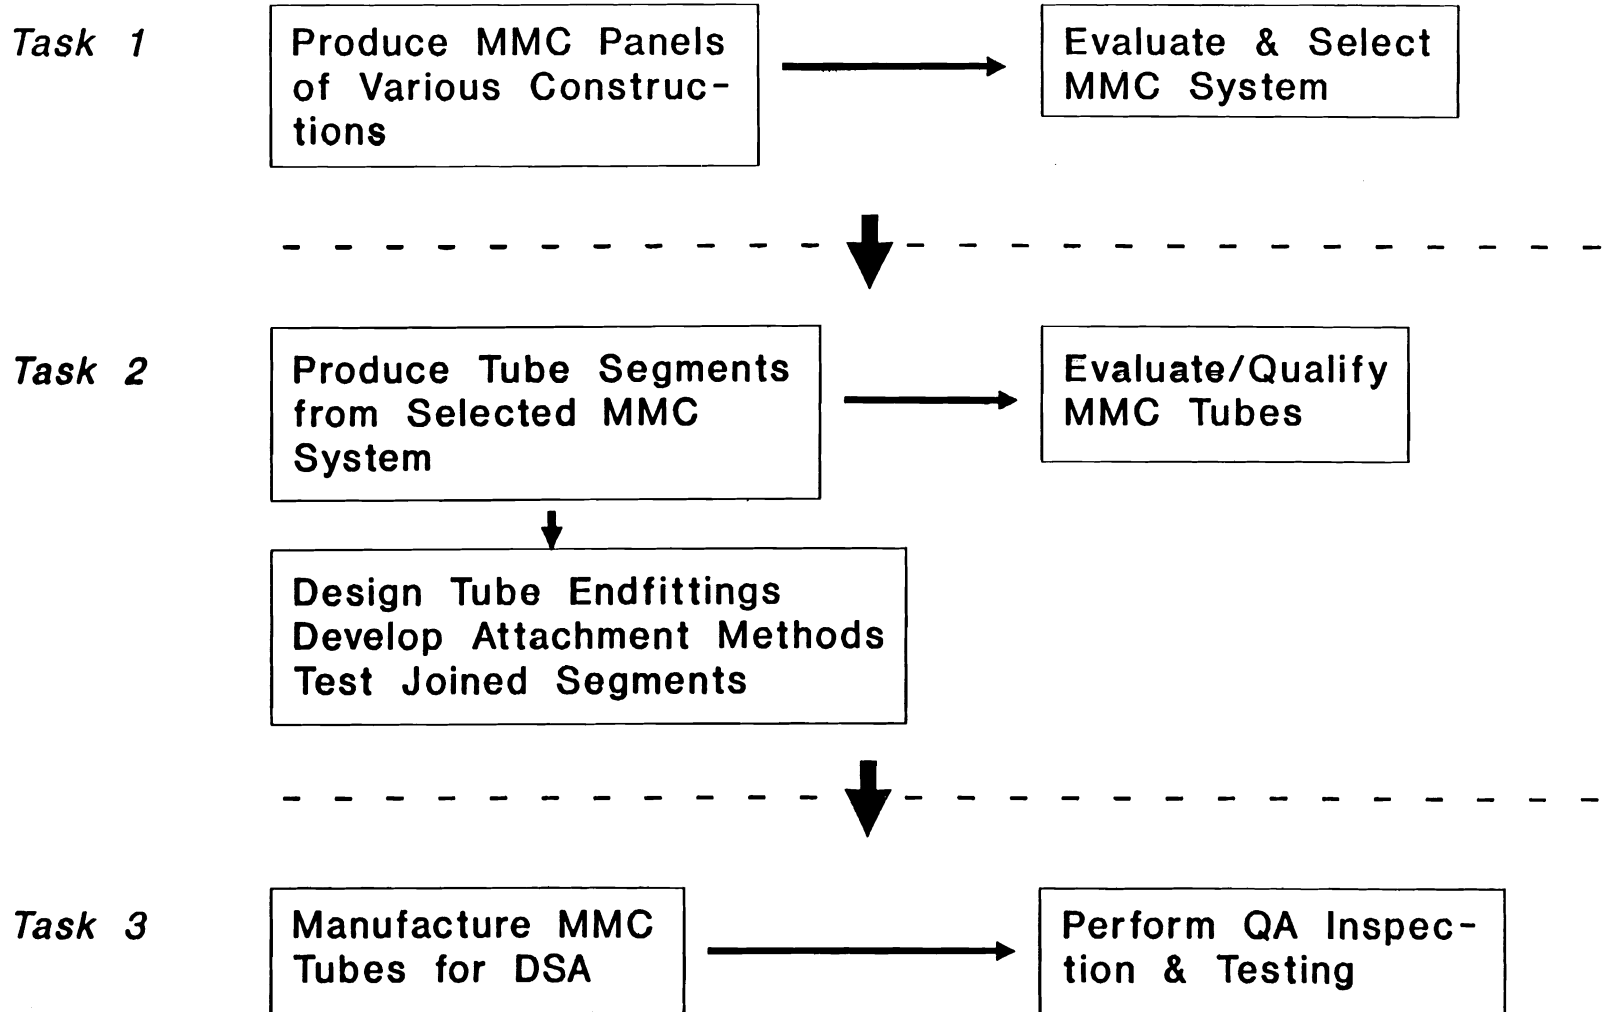

- o High axial specific stiffness**
- o Near zero axial CTE**
- o Dimensionally stable**

**Structure Must Withstand Loads Induced During Assembly and Launch**

**Desired Material Features -**

- o Unidirectional ultra-high modulus graphite fiber (Dupont E120), with high fiber loading and Mg matrix, for high stiffness, low density, and near zero CTE**
- o Consistent fiber loading and impregnation for consistent property performance**
- o Fine matrix grain structure for increased composite transverse and shear strength**

# Program Approach for MMC Tube Development

# WHY VISCOELASTIC MATERIALS ?

- Unlike Metals Viscoelastic Materials (VEM) Have High Loss Factors

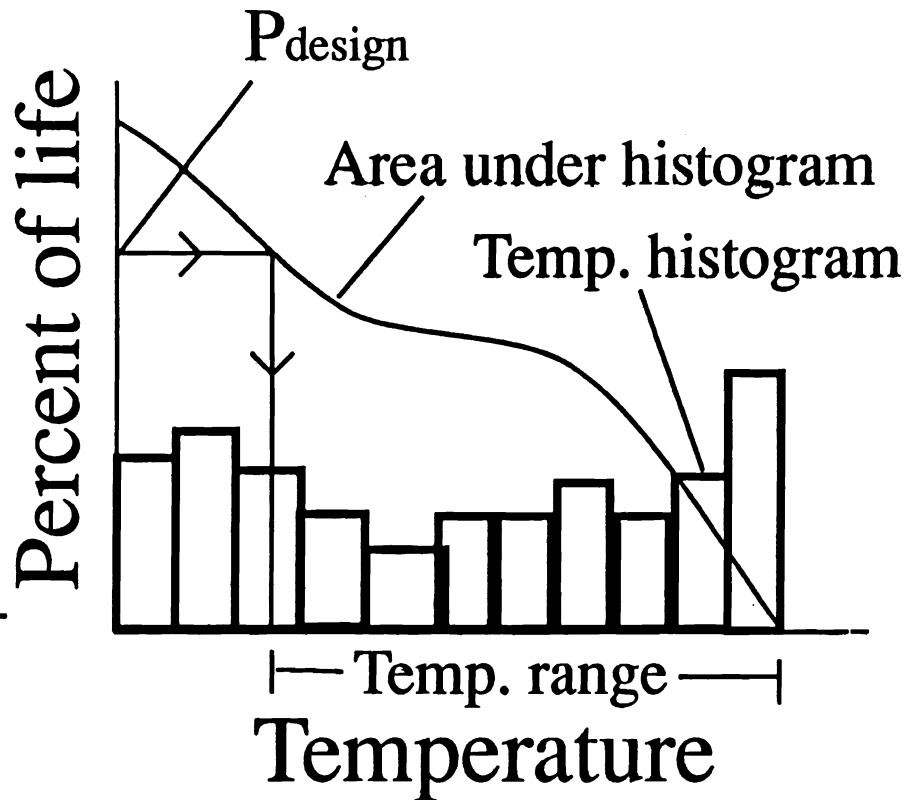

# VEM DYNAMIC PROPERTIES

(\*) PAPER STUDY ONLY

(\*\*) TWO SETS OF TESTS AND ANALYSES: WITH AND WITHOUT INTEGRALLY DESIGN DAMPING.

# **T E C H N I C A L   A P P R O A C H   (C O N T . )**

## **MODULAR JOINT DESIGN**

- **THE MMC DSA WILL INCORPORATE MODULAR JOINT DESIGNS WHICH WILL INCORPORATE REMOVABLE VISCOELASTIC MATERIALS (VEM)**
- **SINCE THE VEM ELEMENTS ARE REMOVABLE, THE SAME MMC STRUCTURE WILL BE TESTED WITH AND WITHOUT DAMPING ELEMENTS**
- **SEVERAL JOINT DESIGNS HAVE BEEN IDENTIFIED**

# DISTURBANCES

- Rotating Equipment : Reaction Wheels (RWA)
- Flow Induced Disturbances
- Slew Maneuvers : Settling Time
- Thermal History

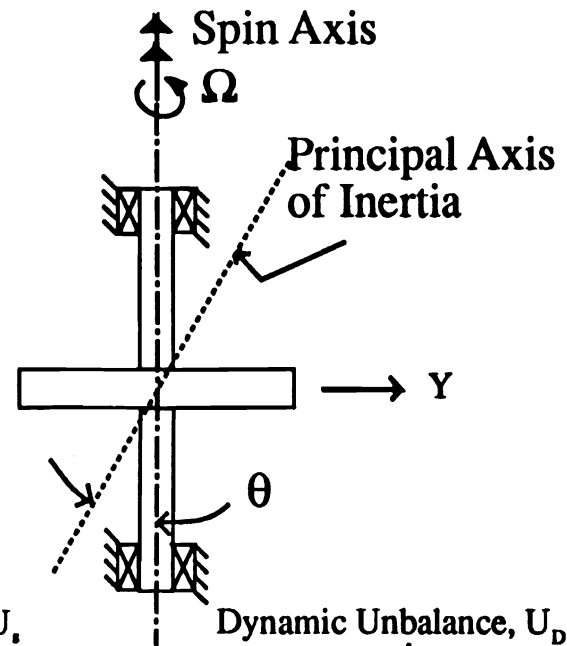

# ROTOR STATIC & DYNAMIC UNBALANCE

- Force or Moment :  $F = \delta M \Omega^2$ 

$$\left\{ \begin{array}{l} F = \text{Force or Moment (lb or in-lb)} \\ M = \text{Rotor Mass (lb-sec}^2/\text{in)} \\ \Omega = \text{Wheel Speed (Rad/sec)} \\ \delta = \text{Disturbance Amplitude (in. or in.}^2 \text{ tabulated)} \end{array} \right.$$

$$F = m\Delta_s\Omega^2 = \frac{w\Delta_s\Omega^2}{g}$$

$$T_x = (J_p - J_{xx})\theta\Omega^2 = \frac{(J_p - J_{xx})g\theta\Omega^2}{g}$$

**Definitions:**

- GEO : Geosynchronous orbit
- LEO : Low Earth orbit
- Inside : DAMMPS DSA inside spacecraft
- Outside : DAMMPS DSA outside spacecraft
- L : Low thermal coupling with spacecraft
- H : High thermal coupling with spacecraft

# DAMMPS Thermal Modeling

- **TRASYS surface model was developed to provide radiation exchange factors and orbital heat fluxes for different seasons and optical properties.**
- **A 75 node SINDA thermal model was used to provide predicted temperatures for two sample cases:**
  - (1) For summer solstice with S13GLO white paint at EOL**
  - (2) For equinox with leafing aluminum paint at BOL**
- **Other assumptions:**
  - (a) Thermal control on the structure by using different coatings.**
  - (b) The structure is mounted outside a spacecraft.**
  - (c) Thermal conductivity of the tubes,  $K = 110 \text{ Btu/hr-}^{\circ}\text{F-ft}$ .**
  - (d) Tube material is 50% graphite/50% magnesium alloy.**
  - (e) Interface conductance of  $0.50 \text{ Btu/hr-}^{\circ}\text{F}$  between spacecraft and DAMMPS DSA.**

# RESPONSE ANALYSES

- Response Levels Due to RWA Disturbances

- Amplitude Reduction by a Factor of 10 to 200 Hz Over Undamped Structure (Goal: Factor of 5)

- Response Levels Due to Slew Maneuvers

- Undamped Settling Time  $> 10$  Sec.

- Damped Settling Time = .35 Sec.

- Goal: Factor of Ten

# RESPONSE ANALYSES

## •RMS Response Levels Due to Coolant Flow Disturbance

| Quantity                      | Undamped | Damped |
|-------------------------------|----------|--------|
| Pointing X ( $\mu\text{in}$ ) | 1049     | 225    |
| Pointing Y ( $\mu\text{in}$ ) | 1112     | 271    |
| Pointing Z ( $\mu\text{in}$ ) | 16.34    | 2.116  |
| LOS X ( $\mu\text{rad}$ )     | 6.993    | 2.263  |
| LOS Y ( $\mu\text{rad}$ )     | 6.273    | 1.867  |
| LOS Z ( $\mu\text{rad}$ )     | .1828    | .0649  |

## • Response Reductions to 1000 Hz : By Factors 2.8 to 7.7
